ABSTRACT

The present invention relates to pyrazine derivatives such as those represented by Formulas (I) and (II) below. X to X of the compounds of Formulas I and II may be characterized as electron withdrawing groups. In contrast, Y to Y of the compounds of Formulas I and II may be characterized as electron donating groups. Pyrazine derivatives of the present invention may be utilized in assessing renal function. In particular, an effective amount of a pyrazine derivative of the invention may be administered into a body of a patient. The pyrazine derivative that is in the body may be exposed to visible and/or infrared light to cause spectral energy to emanate from the pyrazine derivative. This emanating spectral energy may be detected and utilized to determine renal function of the patient.

PYRINE DERIVATIVES AND USES THEREOF IN RENIAL MONITORING

REFERENCE TO RELATED APPLICATIONS

This application: claims priority to International Application No. PCT/US2007/014370 filed on 20 Jun. 2007, which claims priority to U.S. Provisional Application No. 60/815,712 filed on 22 Jun. 2006; AND

Each of the above-referenced applications is expressly incorporated by reference herein it is entirety.

FIELD OF THE INVENTION

The present invention relates to pyazine derivatives capable of absorbing and emanating spectral energy in the visible and/or near infrared spectrum. In addition, the present invention relates to methods of using non-radioactive, exogenous agents such as the previously mentioned pyrazine derivatives in medical procedures (e.g., the monitoring of renal function).

BACKGROUND

As a preliminary note, various publications are referenced throughout this disclosure by Arabic numerals in brackets. A citation corresponding to each reference number is listed following the detailed description.

Acute renal failure (ARF) is a common ailment in patients admitted to general medical-surgical hospitals. Approximately half of the patients who develop ARF die, and survivors face marked increases in morbidity and prolonged hospitalization [1]. Early diagnosis is generally believed to be important, because renal failure is often asymptomatic and typically requires careful tracking of renal function markers in the blood. Dynamic monitoring of renal functions of patients is desirable in order to minimize the risk of acute renal failure brought about by various clinical, physiological and pathological conditions [2-6]. Such dynamic monitoring tends to be particularly important in the case of critically ill or injured patients, because a large proportion of these patients tend to face risk of multiple organ failure (MOF) potentially resulting in death [7,8]. MOF is a sequential failure of the lungs, liver and kidneys and is induced by one or more of acute lung injury (ALI), adult respiratory distress syndrome (ARDS), hypermetabolism, hypotension, persistent inflammatory focus and sepsis syndrome. The common histological features of hypotension and shock leading to MOF generally include tissue necrosis, vascular congestion, interstitial and cellular edema, hemorrhage and microthrombi. These changes generally affect the lungs, liver, kidneys, intestine, adrenal glands, brain and pancreas in descending order of frequency [9]. The transition from early stages of trauma to clinical MOF generally corresponds with a particular degree of liver and renal failure as well as a change in mortality risk from about 30% up to about 50% [10].

Traditionally, renal function of a patient has been determined using crude measurements of the patient's urine output and plasma creatinine levels [11-13]. These values are frequently misleading because such values are affected by age, state of hydration, renal perfusion, muscle mass, dietary intake, and many other clinical and anthropometric variables. In addition, a single value obtained several hours after sampling may be difficult to correlate with other physiologic events such as blood pressure, cardiac output, state of hydration and other specific clinical events (e.g., hemorrhage, bacteremia, ventilator settings and others).

With regard to conventional renal monitoring procedures, an approximation of a patient's glomerular filtration rate (GFR) can be made via a 24 hour urine collection procedure that (as the name suggests) typically requires about 24 hours for urine collection, several more hours for analysis, and a meticulous bedside collection technique. Unfortunately, the undesirably late timing and significant duration of this conventional procedure can reduce the likelihood of effectively treating the patient and/or saving the kidney(s). As a further drawback to this type of procedure, repeat data tends to be equally as cumbersome to obtain as the originally acquired data.

Occasionally, changes in serum creatinine of a patient must be adjusted based on measurement values such as the patient's urinary electrolytes and osmolality as well as derived calculations such as "renal failure index" and/or "fractional excretion of sodium." Such adjustments of serum creatinine undesirably tend to require contemporaneous collection of additional samples of serum and urine and, after some delay, further calculations. Frequently, dosing of medication is adjusted for renal function and thus can be equally as inaccurate, equally delayed, and as difficult to reassess as the measurement values and calculations upon which the dosing is based. Finally, clinical decisions in the critically ill population are often equally as important in their timing as they are in their accuracy.

It is known that hydrophilic, anionic substances are generally capable of being excreted by the kidneys [14]. Renal clearance typically occurs via two pathways: glomerular filtration and tubular secretion. Tubular secretion may be characterized as an active transport process, and hence, the substances clearing via this pathway typically exhibit specific properties with respect to size, charge and lipophilicity.

Most of the substances that pass through the kidneys are filtered through the glomerulus (a small intertwined group of capillaries in the malpighian body of the kidney). Examples of exogenous substances capable of clearing the kidney via glomerular filtration (hereinafter referred to as "GFR agents") are shown in FIG. 1 and include creatinine (1), o-iodohippuran (2), and 99mTc-DTPA (3) [15-17]. Examples of exogenous substances that are capable of undergoing renal clearance via tubular secretion include 99mTc-MAG3 (4) and other substances known in the art [15, 18, 19]. 99mTc-MAG3 (4) is also widely used to assess renal function through gamma scintigraphy as well as through renal blood flow measurement. As one drawback to the substances illustrated in FIG. 1, o-iodohippuran (2), 99mTc-DTPA (3) and 99mTc-MAG3 (4) include radioisotopes to enable the same to be detected. Even if non-radioactive analogs (e.g., such as an analog of o-iodohippuran (2)) or other non-radioactive substances were to be used for renal function monitoring, such monitoring would typically require the use of undesirable ultraviolet radiation for excitation of those substances.

SUMMARY

In one regard, the present invention relates to transforming lipophilic fluorescent dyes into hydrophilic molecules. One concept of the present invention relates to molecules whose clearance properties are preferably similar to that of creatinine or o-iodohippuran, and to render such molecules hydro-
philic by incorporating appropriate polar functionalities such as hydroxyl, carboxyl, sulfonate, phosphonate and the like into their backbones. Pyrazine dyes of the invention may be characterized by some as being desirable for renal applications because they tend to be cleared from the body via the kidneys, demonstrate absorption and emission/fluorescence in the visible region, and tend to exhibit significant Stokes shifts. These properties allow flexibility in both tuning a molecule to a desired wavelength and introducing a variety of substituents to improve clearance properties.

In a first aspect, the present invention is directed to pyrazine derivatives of Formula I. With regard to Formula I, X₁ and X₂ may be characterized as electron withdrawing substituents and may be independently chosen from the group consisting of —CN, —CO₂R, —CONR’R”, —COR, —NO₂, —SOR₁, —SO₂R₁, —SO₃R, —PO₃R’R”R”, —CO(-AA), and —CONH(Ps). In some embodiments, at least one of X₁ and X₂ is either —CO(-AA) or —CONH(Ps). (AA) is a polypeptide chain that includes one or more natural or unnatural α-aminoc acids linked together by peptide bonds. (Ps) is a sulfated or non-sulfated polysaccharide chain that includes one or more monosaccharide units connected by glycosidic linkages. Y₁ and Y₂ may, at least in some embodiments, be characterized as electron donating substituents and may be independently chosen from the group consisting of —OR₁, —SR₁₁, —NR’R”R”, —N(R’R”)COR’, —P(R’R”)₃, —P(OR’R”)₂, and substituents corresponding to Formula A above. In some embodiments, at least one of Y₁ and Y₂ is either —P(OR’R”)₂ or —P(OR’R”)₃. Z₁ may be a single bond, —CR’R”R’”, —O, —NR’R”, —NCOR’R”, —S, —SO₂R₁, —SO₃R, R₁ to R₂ may be any suitable substituents capable of providing and/or enhancing desired biological and/or physicochemical properties of pyrazine derivatives of Formula I. For instance, for renal function assessment, each of the R groups of R₁ to R₂ may independently be a hydrogen atom, an anionic functional group (e.g., carboxylate, sulfonate, sulfate, phosphate and phosphonate) or a hydrophilic functional group (e.g., hydroxy, carboxyl, sulfonate, and phosphonate). As an example, in some embodiments, R₁ to R₂ may independently be selected from the group consisting of —H, —(CH₂)₉OR₁, —CH₂(CH₂OH)₉R”, —CH₂(CH₂COOH)CO₂H, —(CH₂CO₂H)CO₂H, —(CH₂)₉NR₉R”R”, —CH₂(CH₂)NH₉CO₂H, —CH [(CH₂)₉NH₉]CH₂OH, —CH₂(CH₂NH₉)CH₂NR₉R”R”, —(CH₂)₉CO(CH₂CO₂H)R”, —(CH₂)₉SO₂H, —(CH₂)₉SO₃H, —(CH₂)₉OSO₂H, —(CH₂)₉OSO₃H, —(CH₂)₉PO₃H, —(CH₂)₉PO₄H, —(CH₂)₉PO₄H₂, —(CH₂)₉PO₄H₃, —(CH₂)₉PO₄H₄, and —(CH₂)₉PO₄H₅. In such embodiments, each of R₁ to R₂ may independently be —H or —CH₂, ‘a’, ‘b’, ‘c’, ‘d’, ‘m’ and ‘n’ may be any appropriate integers. For instance, in some embodiments, ‘a’, ‘b’, and ‘d’ may independently vary from 1 to 10, ‘c’ may vary from 1 to 100, and ‘m’ and ‘n’ may independently vary from 1 to 3.

A second aspect of the invention is directed to pyrazine derivatives of Formula II. With regard to Formula II, X₃ and X₄ may be characterized as electron withdrawing substituents and may be independently chosen from the group consisting of —CN, —CO₂R, —CONR’R”, —COR, —NO₂, —SOR₁, —SO₂R₁, —SO₃R, —PO₃R’R”R”, —CO(AA), and —CONH(Ps). In some embodiments, at least one of X₃ and X₄ is either —CO(-AA) or —CONH(Ps). (AA) is a polypeptide chain that includes one or more natural or unnatural α-aminoc acids linked together by peptide bonds. (Ps) is a sulfated or non-sulfated polysaccharide chain that includes one or more monosaccharide units connected by glycosidic linkages. Y₃ and Y₄ may, at least in some embodiments, be characterized as electron donating substituents and may be independently chosen from the group consisting of —OR₁, —SR₁₁, —NR’R”R”, —N(R’R”)COR’, —P(R’R”)₃, —P(OR’R”)₂, and substituents corresponding to Formula B above. In some embodiments, at least one of Y₃ and Y₄ is either —P(OR’R”)₂ or —P(OR’R”)₃. Z₂ may be a single bond, —CR’R”R’”, —O, —NR’R”, —NCOR’R”, —S, —SO₂R₁, —SO₃R, R₁ to R₂ may be any suitable substituents capable of providing and/or enhancing desired biological and/or physicochemical properties of pyrazine derivatives of Formula II. For instance, for renal function assessment, each of the R groups of R₁ to R₂ may independently be any one of a hydrogen atom, an anionic functional group (e.g., carboxylate, sulfonate, sulfate, phosphate and phosphonate) or a hydrophilic functional group (e.g., hydroxy, carboxyl, sulfonate, and phosphonate). As an example, in some embodiments, R₁ to R₂ may independently be selected from the group consisting of —H, —(CH₂)₉OR₁, —CH₂(CH₂OH)₉R”, —CH₂(CH₂COOH)CO₂H, —(CH₂CO₂H)CO₂H, —(CH₂)₉NR₉R”R”, —CH₂(CH₂)NH₉CO₂H, —CH [(CH₂)₉NH₉]CH₂OH, —CH₂(CH₂NH₉)CH₂NR₉R”R”, —(CH₂)₉CO(CH₂CO₂H)R”, —(CH₂)₉SO₂H, —(CH₂)₉SO₃H, —(CH₂)₉OSO₂H, —(CH₂)₉OSO₃H, —(CH₂)₉PO₃H, —(CH₂)₉PO₄H, —(CH₂)₉PO₄H₂, —(CH₂)₉PO₄H₃, —(CH₂)₉PO₄H₄, and —(CH₂)₉PO₄H₅. In such embodiments, each of R₁ to R₂ may independently be —H or —CH₂, ‘f’, ‘g’, ‘h’, ‘p’ and ‘q’ may be any appropriate integers. For instance, in some embodiments, ‘f’, ‘g’, ‘h’ and ‘p’ and ‘q’ may independently vary from 1 to 10, ‘g’ may vary from 1 to 100, and ‘p’ and ‘q’ may independently vary from 1 to 3.

Yet a third aspect of the invention is directed to pharmaceutically acceptable compositions, each of which includes one or more pyrazine derivatives disclosed herein. Incidentally, the phrase “pharmaceutically acceptable” herein refers substances which are, within the scope of sound medical judgment, suitable for use in contact with relevant tissues of humans and animals without undue toxicity, irritation, allergic response and the like, and are commensurate with a rea-
reasonable benefit/risk ratio. The compositions of this third aspect may include one or more appropriate excipients such as, but not limited to, suitable diluents, preservatives, solubilizers, emulsifiers, adjuvant and/or carriers. One example of a composition of this third aspect may include at least one pyrazine derivative of Formula I and at least one pyrazine derivative of Formula II. Another example of a composition of the third aspect may include one or more pyrazine derivatives of Formula I or one or more pyrazine derivatives of Formula II.

Still a fourth aspect of the invention is directed to methods of determining renal function using pyrazine derivatives such as those described above with regard to Formulas I and II. In these methods, an effective amount of a pyrazine derivative is administered to the body of a patient (e.g., a mammal such as a human or animal subject). Essentially, an “effective amount” herein generally refers to an amount of pyrazine derivative that is sufficient to enable renal function to be analyzed. The pyrazine derivative in the body of the patient is exposed to at least one of visible and near infrared light. Due to this exposure of the pyrazine derivative to the visible and/or infrared light, the pyrazine derivative emanates spectral energy that may be detected by appropriate detection equipment. This spectral energy emanating from the pyrazine derivative may be detected using an appropriate detection mechanism such as an invasive or non-invasive optical probe. Herein, “emanating” or the like refers to spectral energy that is emitted and/or fluoresced from a pyrazine derivative. Renal function can be determined based on the spectral energy that is detected. For example, an initial amount of the amount of pyrazine derivative present in the body of a patient may be determined by a magnitude/intensity of light emanated from the pyrazine derivative that is detected (e.g., in the bloodstream). As the pyrazine derivative is cleared from the body, the magnitude/intensity of detected light generally diminishes. Accordingly, a rate at which this magnitude/intensity of detected light diminishes may be correlated to a renal clearance rate of the patient. This detection may be done periodically or in substantially real-time (providing a substantially continuous monitoring of renal function). Indeed, methods of the present invention enable renal function/clearance to be determined via detecting one or both a change and a rate of change of the detected magnitude of spectral energy (indicative of an amount of the pyrazine derivative that has not been cleared) from the portion of the pyrazine derivative that remains in the body. While this fourth aspect has been described with regard to use of a single pyrazine derivative of the invention, it should be noted that some embodiments of this fourth aspect include the use of compositions of the invention that may include one or more pyrazine derivatives disclosed herein.

BRIEF DESCRIPTION OF THE FIGURES

FIG. 1 illustrates some structures of conventional renal agents.

FIG. 2 illustrates a block diagram of an assembly for assessing renal function.

DETAILED DESCRIPTION OF SPECIFIC EMBODIMENTS

As mentioned above, the present invention includes pyrazine derivatives of Formula I. In a first family of embodiments, X1 and X2 are independently selected from the group consisting of —CN, —CO2R, —CONR2, —COR, —NO2, —SR, —SOR2, —SO2R, —PO2R2, —CO (AA), and —CONH(PS), wherein at least one of (e.g., one or both of) X1 and X2 is independently either —CO (AA) or —CONH(PS). For instance, in one group of embodiments, at least one of X1 and X2 is —CONH(PS).

In some embodiments of this first family, X1 and X2 are independently selected from the group consisting of —OR10, —SR11, —NR212, —N(R4)COR15, —P(O)(R)(Y), and substituents corresponding to Formula A above.

In some embodiments of this first family, X1 and X2 are independently selected from the group consisting of —CN, —CO2R, —CONR2, —COR, —NO2, —SR, —SOR2, —SO2R, —PO2R2, —CO (AA), and —CONH(PS). Further, Y1 and Y2 are independently selected from the group consisting of —OR10, —SR11, —NR212, —N(R4)COR15, —P(O)(R)(Y), and substituents corresponding to Formula A above, wherein at least one of (e.g., one of or both of) Y1 and Y2 is independently either —P(O)(R)(Y) or —P(O)(R)(Y), for instance, in one group of embodiments, at least one of Y1 and Y2 is —P(O)(R)(Y). In another group of embodiments, at least one of Y1 and Y2 is —P(O)(R)(Y).

In some embodiments of this second family, X1 and X2 are independently selected from the group consisting of —CN, —CO2R, —CONR2, —CO (AA), and —CONH(PS). In some embodiments of the second family, one of Y1 and Y2 is —P(O)(R)(Y), or —P(O)(R)(Y), and the other of Y1 and Y2 is —NR212 or a substituent corresponding to Formula A above.

With regard to the above-described first and second families, Z1 is selected from the group consisting of a single bond, —CR18R19, —O, —NR20, —NCO21, —S, —SO and —SO2. In some embodiments, Z1 is selected from the group consisting of —O, —NR20, —S, —SO and —SO2. In other embodiments, Z1 is selected from the group consisting of —O and —NR20.

R1 to R2 of the first and second families are independently selected from the group consisting of —H, —(CH2)nOR22, —CO2R23, —CONR2(CHR24), —CH2(CO)2R25, —CH2(CO)2R25, —CH2(CO)2R25, —CH2(CO)2R25, —CH2(CO)2R25, —HCO3H, —(CH3)2NHR26, —CH2NH2CH2OH, and —CH2NH2CH2OH. R27 to R27 of the first and second families are independently selected from the group consisting of —H, —(CH2)nOR22, —CO2R23, —CONR2(CHR24), —CH2(CO)2R25, —CH2(CO)2R25, —CH2(CO)2R25, —CH2(CO)2R25, —CH2(CO)2R25, —HCO3H, —(CH3)2NHR26, —CH2NH2CH2OH, and —CH2NH2CH2OH. 

In such embodiments, R43 to R43 are independently —H or —CH3. In one group of embodiments, R43 to R43 of the first and second families are independently selected.
The present invention also includes pyrazine derivatives corresponding to Formula II above. In a third family of embodiments of the invention, X³ and X⁴ are independently selected from the group consisting of —CN, —CO₂R¹, —CONR₂³⁴, —COR₂⁴, —NO₂, —SOR²⁴, —SO₂R²⁵, —PO₃R²⁶R²⁷R²⁸, —CO₂(AA), and —CONH₂(PS), wherein at least one of (e.g., one of or both of) X³ and X⁴ is independently either —CO₂(AA) or —CONH₂(PS). For instance, in one group of embodiments, at least one of X³ and X⁴ is —CO₂(AA). In another group of embodiments, at least one of X³ and X⁴ is —CONH₂(PS). With further regard to this first family of embodiments, Y¹ and Y² are independently selected from the group consisting of —OR³¹, —SR³², —NR₃⁴R₃³, —N(R³⁵)COR₃⁶, —P(R³⁷)₃, —P(OR₃⁸)₃, and substituents corresponding to Formula B above.

In some embodiments of this third family, X³ and X⁴ are independently selected from the group consisting of —CN, —CO₂R¹, —CONR₂³⁴, —COR₂⁴, —NO₂, —SOR²⁴, —SO₂R²⁵, —PO₃R²⁶R²⁷R²⁸, —CO₂(AA), and —CONH₂(PS), wherein at least one of X³ and X⁴ is independently either —CO₂(AA) or —CONH₂(PS). Y¹ and Y² of some embodiments of the third family are independently selected from the group consisting of —NR₃⁴R₃³ and substituents corresponding to Formula B above. In still another fourth family of embodiments, X³ and X⁴ are independently selected from the group consisting of —CN, —CO₂R¹, —CONR₂³⁴, —COR₂⁴, —NO₂, —SOR²⁴, —SO₂R²⁵, —PO₃R²⁶R²⁷R²⁸, —CO₂(AA), and —CONH₂(PS). Further, Y¹ and Y² are independently selected from the group consisting of —OR³¹, —SR³², —NR₃⁴R₃³, —N(R³⁵)COR₃⁶, —P(R³⁷)₃, —P(OR₃⁸)₃, and substituents corresponding to Formula B above, wherein at least one of Y¹ and Y² is independently either —P(R³⁷)₃ or —P(OR₃⁸)₃. For instance, in one group of embodiments, at least one of Y¹ and Y² is —P(R³⁷)₃. In another group of embodiments, at least one of Y¹ and Y² is —P(OR₃⁸)₃.

In some embodiments of this fourth family, X³ and X⁴ are independently selected from the group consisting of —CN, —CO₂R¹, —CONR₂³⁴, —COR₂⁴, —NO₂, —SOR²⁴, —SO₂R²⁵, —PO₃R²⁶R²⁷R²⁸, —CO₂(AA), and —CONH₂(PS). In some embodiments of the fourth family, one of Y¹ and Y² is —P(R³⁷)₃ or —P(OR₃⁸)₃, and the other of Y¹ and Y² is —NR₃⁴R₃³ or a substituent corresponding to Formula B above. With regard to the above-described third and fourth families, Z² is selected from the group consisting of a single bond, —CR³⁹R⁴⁰, —O, —NR₄¹, —CONR₂³⁴, —S, —SO, and —SO₂. In some embodiments, Z² is selected from the group consisting of —O, —NR₄¹, —S, —SO and —SO₂. In some embodiments, Z² is selected from the group consisting of —O and —NR₄¹.

R²⁵ to R⁵⁹ are independently selected from the group consisting of —H, —(CH₂)OR¹⁷, —(CH₂)(CHOH)R¹⁸, —(CH₂)[(CH₂)₂NH]₂CH₂OH, —(CH₂)(CH₂OH)CO₂H, —(CH₂)₄NR₅⁵R₅⁶, —(CH₂)₅CO₂H, —CH [(CH₂)₃CH₂]₂CH₂OH, —(CH₂)(CH₂NH)₂CH₂NR₃⁴R₃³, —(CH₂)₃CO₂H, and —(CH₂)₄CO₂H. In such embodiments, R²⁵ to R⁵⁹ are independently —H or —CH₃. In one group of embodiments, R²⁵ to R⁵⁹ are independently selected from the group consisting of —H, —(CH₂)OR¹⁷, —(CH₂)(CHOH)R¹⁸, —(CH₂)(CH₂OH)CO₂H, —(CH₂)₄NR₅⁵R₅⁶, —(CH₂)₅CO₂H, —CH [(CH₂)₃CH₂]₂CH₂OH, —(CH₂)(CH₂NH)₂CH₂NR₃⁴R₃³, —(CH₂)₃CO₂H, and —(CH₂)₄CO₂H.
—(CH₂)₂NR³⁵R⁵⁶, —CH(C₄H₉)₂NHCH₂CH₂OH, —CH₂CH(NH₂)CH₂NR³⁵R⁵⁶, —(CH₂)₂CO(CHOH)(CH₂)₃R⁵⁷, and —(CH₂)₂CO(CH₂CH₂O)₅R⁵⁸. In another group of embodiments, R⁴⁶ to R⁴⁵ are independently selected from the group consisting of H, —(CH₂)₃OR⁵¹, —CH₂(OH)R⁵², —(CH₂)NR³⁵R⁵⁶, —(CH₂)₂CO(CH₂CH₂O)₅R⁵⁸. In a third group of embodiments, R⁵⁵ to R⁴⁶ are independently selected from the group consisting of H, —(CH₂)₃OR⁵¹, —CH₂(OH)R⁵², —(CH₂)NR³⁵R⁵⁶, and —(CH₂)₂CO(CH₂CH₂O)₅R⁵⁸.

Still with regard to the third and fourth families, ‘e’, ‘f’, and ‘h’ independently vary from 1 to 10, ‘g’ varies from 1 to 100, and ‘p’ and ‘q’ independently vary from 1 to 3. In some embodiments, ‘e’, ‘f’, and ‘h’ independently vary from 1 to 6. In some embodiments, ‘g’ varies from 1 to 20. In some embodiments, ‘m’ and ‘n’ are independently 0 or 1.

As with the first and second families of embodiments described above, (AA) of the third and fourth families is a polypeptide chain including one or more natural or unnatural α-amino acids linked together by peptide bonds. Accordingly, the description of (M) with reference to the first and second families of embodiments above applies to (AA) of the third and fourth families of embodiments as well. Likewise, (PS) of the third and fourth families is a sulfated or non-sulfated polysaccharide chain including one or more monosaccharide units connected by glycosidic linkages. As such, the description of (PS) with reference to the first and second families of embodiments above applies to (PS) of the third and fourth families of embodiments as well.

Syntheses of pyrazine derivatives, in general, have been previously studied [27] and described [25, 26, 28, 29]. Preparation procedures for some of the pyrazine derivatives of the present invention, using procedures similar to the above references, are described later in Examples 1 to 11. It is noteworthy that the alkylation of the electron donating amino group in cyano- or carboxypyrazines has a profound effect on electronic transition of the pyrazine chromophore in that the alkylation of the amino group in 2,5-diamino-3,5-dicyanopyrazine produces large bathochromic shift of about 40-60 nm. It is also noteworthy that the pyrrolidine and piperidine derivatives exhibit substantial difference in their UV spectra in that the former exhibits a bathochromic shift of about 34 nm. These results could be explained on the basis that the highest occupied molecular orbital (HOMO) of the alkylated aminopyrazine is destabilized compared to the parent amino compound. Therefore, based on the above premise, it is predicted that pyrazine derivatives containing highly strained azacycloundecyl substituents, which were not disclosed previously, exhibit larger bathochromic shifts compared to unstrained cyclic analogs.

In accordance with the present invention, one protocol for assessing physiological function of body cells includes administering an effective amount of a pyrazine derivative represented by Formula 1 or II into a body of a patient. An appropriate dosage of the pyrazine derivative that is administered to the patient is readily determinable by one of ordinary skill in the art and may vary according to the clinical procedure contemplated, generally ranging from about 1 nanomolar to about 100 micromolar. The administration of the pyrazine derivative to the patient may occur by any of a number of appropriate fashions including, but not limited to: (1) intravenous, intraperitoneal, or subcutaneous injection or infusion; (2) oral administration; (3) transdermal absorption through the skin; and (4) inhalation.

Pyrazine derivatives of this invention can be administered as solutions in most pharmaceutically acceptable intravenous vehicles known in the art. Pharmacologically acceptable vehicles that are well known to those skilled in the art include, but are not limited to, 0.01-0.1 M phosphate buffer or 0.85% saline. Additionally, pharmaceutically acceptable carriers may be aqueous or non-aqueous solutions, suspensions, emulsions, or appropriate combinations thereof. Examples of non-aqueous solvents are propylene glycol, polyethylene glycol, vegetable oils such as olive oil, and injectable organic esters such as ethyl CH₃). Examples of aqueous carriers are water, alcohol/aqueous solutions, emulsions or suspensions, including saline and buffered media. Exemplary parenteral vehicles include sodium chloride solution, Ring-er’s dextrose, dextrose and sodium chloride, lactated Ring-er’s or fixed oils. Exemplary intravenous vehicles include fluid and nutrient replenishers, electrolyte replenishers such as those based on Ringer’s dextrose, and the like. Preservatives and other additives may also be present, such as, for example, antimicrobials, antioxidants, collating agents, inert gases and the like.

Suitable diluents, preservatives, solubilizers, emulsifiers, adjuvants and/or carriers are also suitable excipients. Such compositions are liquids or lyophilized or otherwise dried formulations and include diluents of various buffer content (e.g., Tris-HCl, acetate, phosphate), pH and ionic strength, additives such as albumin or gelatin to prevent absorption to surfaces, detergents (e.g., Tween 20, Tween 80, Pluronic F68, bile acid salts), solubilizing agents (e.g., glycerol, polyethylene glycerol), anti-oxidants (e.g., ascorbic acid, sodium metabisulfite), preservatives (e.g., Thimerosal, benzyl alcohol, parabens), bulking substances or toxicity modifiers (e.g., lactose, mannitol), complexation with metal ions, or incorporation of the material into or onto particulate preparations of polymeric compounds such as polylactic acid, polyglycolic acid, hydrogels, etc., or onto liposomes, microemulsions, micelles, unilamellar or multilamellar vesicles, erythrocyte ghosts, or spheroplasts. Such compositions may likely influence the physical state, solubility, stability, rate of in vivo release, and/or rate of in vivo clearance.

Still referring to the above-mentioned protocol, the pyrazine derivative is exposed to visible and/or near infrared light. This exposure of the pyrazine derivative to light may occur at any appropriate time but preferably occurs while the pyrazine derivative is located in the body. Due to this exposure of the pyrazine derivative to the visible and/or infrared light, the pyrazine derivative emanates spectral energy (e.g., visible and/or near infrared light) that may be detected by appropriate detection equipment. The spectral energy emanated from the pyrazine derivative tends to exhibit a wavelength range greater than a wavelength range absorbed by the pyrazine derivative. For example, if an embodiment of the pyrazine derivative absorbs light of about 700 nm, the pyrazine derivative may emit light of about 745 nm.

Detection of the pyrazine derivative (or more particularly, the light emanating therefrom) may be achieved through optical fluorescence, absorbance or light scattering procedures known in the art. In one embodiment, this detection of the emanated spectral energy may be characterized as a collection of the emanated spectral energy and a generation of electrical signal indicative of the collected spectral energy. The mechanism(s) utilized to detect the spectral energy from the pyrazine derivative that is present in the body may be designed to detect only selected wavelengths (or wavelength ranges) and/or may include one or more appropriate spectral filters. Various cathers, for example, the use of a number of appropriate fashions including, but not limited to: (1) intravenous, intraperitoneal, or subcutaneous injection or infusion; (2) oral administration; (3) transdermal absorption through the skin; and (4) inhalation.

Renal function of the patient can be determined based on the detected spectral energy. This can be achieved by using data indicative of the detected spectral energy and generating an intensity/time profile indicative of a clearance of the pyra-
A mixture of 3,6-diaminopyrazine-2,5-dicarboxylic acid (200 mg, 1.01 mmol), bis-2-(methoxyethyl)amine (372 μL, 335.5 mg, 2.52 mmol), HOBT-H₂O (459 mg, 3.00 mmol), and EDCl (755 mg, 3.00 mmol) were stirred together in DMF (20 mL) for 1 h at room temperature. The mixture was concentrated to dryness and the residue was partitioned with EtOAc and water. The layers were separated and the EtOAc solution was washed with saturated NaHCO₃ and brine. The solution was dried over anhydrous Na₂SO₄, filtered and concentrated. Purification by radial flash chromatography (SiO₂, 10/1 CHCl₃:MeOH) afforded 228.7 mg (53% yield) of Example 1 as an orange foam. ¹H NMR (300 MHz, CDCl₃), δ 9.42 (s, 4H), 3.76 (apparent t, J=5.4 Hz, 4H), 3.70 (apparent t, J=5.6 Hz, 4H), 3.64 (apparent t, J=5.4 Hz, 4H), 3.565 (apparent t, J=5.4 Hz, 3.67 (s, 6H), 3.28 (s, 6H). ¹³C NMR (75 MHz, CDCl₃) δ 167.6 (s), 145.6 (s), 131.0 (s), 72.0 (t), 70.8 (t), 59.2 (g), 49.7 (t), 47.1 (t). LCMS (5-95% gradient acetonitrile in 0.1% TFA over 10 min), single peak retention time=3.14 min on 30 mm column, (M+H)⁺=429. UV/vis (100 μM in PBS) λₘₐₓ=394 nm. Fluorescence (100 nm) λₘₐₓ=394 nm λₑₘₐₓ=550 nm.

Example 2
3,6-diamino-N²,N²-bis(2,3-dihydroxypropyl)pyrazine-2,5-dicarboxamide

Step 1. Synthesis of 3,6-diamino-N²,N²-bis(2,2-dimethyl-1,3-dioxolan-4-yl)methylpyrazine-2,5-dicarboxamide

A mixture of 3,6-diaminopyrazine-2,5-dicarboxylic acid (350 mg, 1.77 mmol), racemic (2,2-dimethyl-1,3-dioxolan-4-yl)methanamine (933 μL, 944 mg, 7.20 mmol), HOBT-H₂O (812 mg, 5.33 mmol), and EDCl (1.02 g, 5.32 mmol) were stirred together in DMF (20 mL) for 16 h at room temperature. The mixture was concentrated to dryness and the residue was partitioned with EtOAc and water. The layers were separated and the EtOAc solution was washed with saturated NaHCO₃ and brine. The solution was dried over anhydrous Na₂SO₄; filtered and concentrated to afford 665 mg (88% yield) of the bis-amide diastereomeric pair as a yellow solid. ¹H NMR (300 MHz, CDCl₃) δ 8.38 (t, J=5.8 Hz, 2H), 6.55 (s, 4H), 4.21 (quartet, J=5.8 Hz, 2H), 3.98 (dd, J=8.4 Hz, 6.3 Hz, 2H), 3.65 (dd, J=8.4 Hz, J=5.8 Hz, 2H), 3.39 (apparent quartet—diastereotopic mixture, J=5.9 Hz, 4H), 1.35 (s, 6H), 1.26 (s, 6H). ¹³C NMR (75 MHz, CDCl₃) δ 165.7 (s), 146.8 (s), 126.8 (s), 109.2 (s), 74.8 (d), 67.2 (t), 42.2, 41.1 (t—diastereotopic pair), 27.6 (q), 26.1 (q).

Step 2. The product from Step 1 was dissolved in THF (100 mL) and treated with 1.0 N HCl (2 mL). After hydrolysis was complete, the mixture was treated with K₂CO₃ (1 g) and stirred for 1 h and filtered through a plug of C18 with using
methanol. The filtrate was concentrated to dryness and the residue was triturated with MeOH (50 mL). The solids were filtered and discarded and the residue was treated with ether (50 mL). The precipitate was collected by filtration and dried at high vacuum. This material was purified by radial flash chromatography to afford 221 mg (36% yield) of Example 2 as an orange solid: 1H NMR (500 MHz, DMSO-d$_6$) δ 8.00 (br, 6H, 6H), 5.39 (bs, 2H), 4.88 (bs, 2H), 3.63-3.71 (complex m, 2H), 3.40 (dd, J=11.1, 5.10 Hz, 2H), 3.28 (dd, J=11.1, 6.60 Hz, 2H), 2.92 (dd, J=12.6, 3.3 Hz, 2H), 2.65 (dd, J=12.6, 8.4 Hz, 2H). LCMS (5-95% gradient acetonitrile in 0.1% TFA over 10 min), single peak retention time=4.13 min on 30 mm column, (M+H)$^+$=345. UV/vis (100 μM in H$_2$O) λ$_{abs}$=432 nm. Fluorescence λ$_{exc}$=432 nm, λ$_{em}$=558 nm.

Example 3

3,6-Diamino-N$_2$N$_2$-bis(serine)-pyrazine-2,5-dicarboxamide

Step 1. Synthesis of 3,6-Diamino-N$_2$N$_2$-bis(O-benzylserine methyl ester)-pyrazine-2,5-dicarboxamide

A mixture of sodium 3,6-diaminopyrazine-2,5-dicarboxylate (300 mg, 1.24 mmol), Ser(OBn) — OMe — HCl salt (647 mg, 2.64 mmol), HOBt-H$_2$O (570 mg, 3.72 mmol) and EDC-HCl (690 mg, 3.60 mmol) in DMF (25 mL) was treated with TEA (2 mL). The resulting mixture was stirred for 16 h and concentrated. Work up as in Example 1 afforded 370 mg (51% yield) of the bisamide as a dark yellow powder: 1H NMR (300 MHz, CDCl$_3$) δ 8.47 (d, J=8.7, 4H), 1H, 2H, 2.75-2.37 (complex m, 10H), 5.98 (bs, 4H), 4.85 (dt, J=8.7, 3.3 Hz, 2H), 4.56 (ABq, J=12.6, Hz, Δv=11.9 Hz, 4H), 3.99 (one half of an ABq of d, J=8.7, 3.3, Δv obscured, 2H), 3.76-3.80 (one half of an ABq — obscured, 2H), 3.78 (s, 6H). 13C NMR (75 MHz, CDCl$_3$) δ 170.5 (s), 165.1 (s), 146.8 (s), 138.7 (s) 128.6 (d), 128.1 (d), 127.8 (d), 126.9 (s), 123.5 (t), 69.8 (t), 53.1 (q), 52.2 (q). LCMS (5-95% gradient acetonitrile in 0.1% TFA over 10 min), single peak retention time=4.93 min on 30 mm column, (M+H)$^+$=581.

Step 2. Synthesis of 3,6-Diamino-N$_2$N$_2$-bis(O-benzylserine)-pyrazine-2,5-dicarboxamide

The product from step 1 (370 mg, 0.64 mmol) in THF (10 mL) was treated with 1.0 N sodium hydroxide (2.5 mL). After stirring at room temperature for 30 min, the reaction was judged complete by TLC. The pH was adjusted to approximately 2 by the addition of 1.0 N HCl and the resulting solution was extracted (3×) with EtOAc. The layers were combined, dried over sodium sulfate, filtered and concentrated to afford 355 mg (100% yield) of the diacid as an orange foam: LCMS (5-95% gradient acetonitrile in 0.1% TFA over 10 min), retention time=4.41 min on 30 mm column, (M+H)$^+$=553.

Step 3. To the product from step 2 (355 mg, 0.64 mmol) in methanol (20 mL) was added 5% Pd/C (300 mg) and ammonium formate (600 mg). The resulting reaction was heated at reflux for 2 h. The reaction was cooled to room temperature, filtered through a plug of celite and concentrated. The residue was recrystallized from methanol-ether to provide 191 mg (80% yield) of Example 3 as a yellow foam: 1H NMR (300 MHz, CDCl$_3$) δ 8.48 (d, J=6.9 Hz, 2H), 6.72 (bs, 4H), 3.95 (apparent quartet, J=5.1 Hz, 2H), 3.60 (apparent ABq of doublets; down-field group centered at 3.71, J=9.9, 5.1 Hz, 2H; up-field group centered at 3.48, J=9.9, 6.3 Hz, 2H), 13C NMR (75 MHz, CDCl$_3$) δ 172.9 (s), 164.9 (s), 147.0 (s), 127.0 (s), 62.9 (d), 55.7 (t). LCMS (5-95% gradient acetonitrile in 0.1% TFA over 10 min), single peak retention time=1.45 min on 30 mm column, (M+H)$^+$=373. UV/vis (100 μM in PBS) λ$_{abs}$=434 nm. Fluorescence λ$_{exc}$=449 nm, λ$_{em}$=559 nm.

Example 4

3,6-bis(2-methoxyethylamino)-N$_2$N$_2$N$_2$N$_2$-tetrakis(2-methoxyethyl)pyrazine-2,5-dicarboxamide bis TFA salt
Step 1. Synthesis of 3,6-dibromopyrazine-2,5-dicarboxylic Acid

3,6-Diaminopyrazine-2,5-dicarboxylic acid (499 mg, 2.52 mmol) was dissolved in 48% hydrobromic acid (10 mL) and cooled to 0°C in an ice-salt bath. To this stirred mixture was added a solution of sodium nitrite (695 mg, 10.1 mmol) in water (10 mL) dropwise so that the temperature remains below 5°C. The resulting mixture was stirred for 3 h at 5-15°C, during which time the red mixture became a yellow solution. The yellow solution was poured into a solution of cupric bromide (2.23 g, 10.1 mmol) in water (100 mL) and the resulting mixture was stirred at room temperature. After an additional 3 h, the aqueous mixture was extracted with EtOAc (3x). The combined extracts were dried (Na2SO4), filtered and concentrated to afford 440 mg (54% yield) 3,6-dibromopyrazine-2,5-dicarboxylic acid as a pale yellow solid. 1H NMR (75 MHz, CDCl3) δ 164.3 (s), 148.8 (s), 134.9 (s). HPLC (5-95% gradient acetonitrile in 0.1% TFA over 10 min), single peak retention time=2.95 min on 250 mm column.

Step 2. Synthesis of 3-(Bis(2-methoxyethyl)amino)-6-bromo-N2,N2,N3,N3,N4,tetakis(2-methoxyethyl)pyrazine-2,5-dicarboxamide

The product from step 1 (440 mg, 1.36 mmol) was dissolved in DMF (25 mL), treated with HOBt-H2O (624 mg, 4.08 mmol), and EDC-HCl (786 mg, 4.10 mmol) and stirred for 30 min at room temperature. Bis(2-methoxyethyl)amine (620 mL, 559 mg, 4.20 mmol) was added and the resulting mixture was stirred at room temperature for 16 h and concentrated. The residue was partitioned with water and EtOAc. The EtOAc layer was separated and the aqueous extract was again extracted with EtOAc. The combined organic layers were washed with 0.5 N HCl, saturated sodium bicarbonate, and brine. The organic layer was dried (Na2SO4), filtered, and concentrated to afford 214 mg of 3-(bis(2-methoxyethyl)amino)-6-bromo-N2,N2,N3,N3,N4,tetakis(2-methoxyethyl)pyrazine-2,5-dicarboxamide (26% yield) as a brown oil. LCMS (5-95% gradient acetonitrile in 0.1% TFA over 10 min), single peak retention time=3.85 min on 30 mm column, (M+H)=608.

Step 3. To the product from step 2 (116 mg, 0.19 mmol) was added bis(2-methoxyethyl)amine (3.0 mL, 2.71 g, 20.3 mmol) and a “spatula tip” of Pd(PPh3)4. The resulting mixture was heated to 140°C for 2 h. The reaction was cooled and concentrated. The residue was purified by flash chromatography (SiO2, 10:1 CHCl3-MeOH). The resulting material was purified again by reverse phase medium pressure chromatography (C18, 10-90% manual gradient acetonitrile in 0.1% TFA) to afford 12 mg (10% yield) of Example 4 as an orange-brown film: LCMS (5-95% gradient acetonitrile in 0.1% TFA) over 10 min, single peak retention time=3.62 min on 30 mm column, (M+H)=526.

Example 5

3,6-diamino-N2,N4-bis[2-aminoethyl]pyrazine-2,5-dicarboxamide Bis TFA Salt

A mixture of sodium 3,6-diaminopyrazine-2,5-dicarboxylate (500 mg, 2.07 mmol), tert-butyl 2-aminoethylcarbamate (673 mg, 4.20 mmol), HOBt-H2O (836 mg, 5.46 mmol) and EDC-HCl (1.05 g, 5.48 mmol) in DMF (25 mL) was stirred for 16 h and concentrated. Work up as in Example 1 afforded 770 mg (76% yield) of the bisamide as an orange foam: 1H NMR (300 MHz, DMSO-d6) δ 8.44 (t, J=5.7 Hz, 2H), 7.66 (bs, 2H), 7.43 (m, 4H), 1.37 (s, 9H), 1.35 (s, 9H). 13C NMR (75 MHz, DMSO-d6), conformational isomers δ 165.1 (s), 155.5 (bs), 155.4 (bs), 146.0 (s), 126.2 (s), 77.7 (bs), 77.5 (bs), 45.2 (bt), 44.5 (bt), 28.2 (q).

Step 2. To the product from step 1 (770 mg, 1.60 mmol) in methylene chloride (100 mL) was added TFA (25 mL) and the reaction was stirred at room temperature for 2 h. The mixture was concentrated and the residue taken up into methanol (15 mL). Ether (200 mL) was added and the organic solid precipitate was isolated by filtration and dried at high vacuum to afford 627 mg (77% yield) of Example 5 as an orange powder: 1H NMR (300 MHz, DMSO-d6) δ 8.70 (t, J=5.7 Hz, 2H), 7.16 (bs, 6H), 7.40 (bs, 4H), 3.36-3.38 (m, 4H), 3.26-3.40 (m, 4H), 1.26 (m, 4H), 1.24 (s, 9H). LCMS (5-95% gradient acetonitrile in 0.1% TFA over 10 min), single peak retention time=3.62 min on 30 mm column, (M+H)=283. UV/vis (100 μM in PBS) λmax=449 nm, λmax=526 nm.

Example 6

3,6-Diamino-N2,N4-bis[D-Aspartate]-pyrazine-2,5-dicarboxamide
Step 1. Synthesis of 3,6-Diamino-N\textsuperscript{2},N\textsuperscript{2}-bis(benzyl D-Obenzyl-Aspartate)-pyrazine-2,5-dicarboxamide

A mixture of sodium 3,6-diaminopyrazine-2,5-dicarboxylate (600 mg, 2.48 mmol), Asp(OBn)-OMe-p-TosH salt (2.43 g, 5.00 mmol), HOBr-H\textsubscript{2}O (919 mg, 6.00 mmol) and EDC-HCl (1.14 g, 5.95 mmol) in DMF (50 mL) was treated with TEA (4 mL). The resulting mixture was stirred overnight at room temperature. The reaction mixture was concentrated and the residue was partitioned with water and EtOAc. The EtOAc layer was separated and washed successively with saturated sodium bicarbonate, water and brine. The EtOAc solution was dried (Na\textsubscript{2}SO\textsubscript{4}), filtered and concentrated. The residue was purified by flash chromatography (SiO\textsubscript{2}, 50/1 CHCl\textsubscript{3}-MeOH to 10/1) to afford 1.15 g of the bis-amide (58% yield) as a yellow foam: \textsuperscript{1}NMR (500 MHz, CDCl\textsubscript{3}) \delta 8.61 (d, J=8.4 Hz, 2H), 7.29-7.39 (m, 20H), 5.85 (bs, 4H), 5.22 (ABq, J=10.0 Hz, \Delta\nu=17.3 Hz, 4H), 5.10 (ABq, J=12.2 Hz, \Delta\nu=34.3 Hz, 4H), 5.06-5.09 (obs m, 2H), 3.11 (ABq of d, J=17.0, 5.14 Hz, \Delta\nu=77.9 Hz, 4H). \textsuperscript{13}C NMR (75 MHz, CDCl\textsubscript{3}) \delta 170.7(s), 170.7(s), 165.4(s), 147.0(s), 135.7(s), 135.6(s), 129.0(d), 128.9(d), 128.8(d), 128.75(d), 128.7(d), 126.9(s), 68.0(t), 67.3(t), 49.1(d), 37.0(t). LCMS (5095% gradient acetonitrile in 0.1% TFA over 10 min), single peak retention time=5.97 min on 250 mm column, (M+H\textsuperscript{+})=789.

Step 2. To the product from step 1 (510 mg, 0.65 mmol) was added THF (20 mL) and water (10 mL). The this stirred mixture was added 10% Pd(C) (500 mg) and ammonium formate (1 g). The resulting mixture was heated to 60°C for 2 h and allowed to cool to room temperature. The mixture was filtered through celite and concentrated. The resulting material was purified again by reverse phase medium pressure chromatography (C18, 10-70% manual gradient acetonitrile in 0.1% TFA) to afford 137.8 mg (54% yield) of Example 6 as an orange solid: \textsuperscript{1}NMR (300 MHz, DMSO-d\textsubscript{6}) \delta 8.62 (d, J=8.4 Hz, 2H), 6.67 (bs, 4H), 4.725 (dt, J=8.4, 5.4 Hz, 2H), 2.74-2.88 (complex m, 4H), \textsuperscript{13}C NMR (75 MHz, DMSO-d\textsubscript{6}) \delta 172.6(s), 165.2(s), 147.0(s), 126.6(s), 60.8(t), 49.1(d). LCMS (595% gradient acetonitrile in 0.1% TFA over 10 min), single peak retention time=4.01 min on 250 mm column, (M+H\textsuperscript{+})=429. UV/vis (100 \muM in PBS) \lambda\textsubscript{abs}=433 nm. Fluorescence (100 nM) \lambda\textsubscript{ex}=449 nm, \lambda\textsubscript{em}=558 nm.

Example 7

3,6-Diamino-N\textsuperscript{2},N\textsuperscript{2}-bis(14-oxo-2,5,8,11-tetraoxa15-azahexadecan-17-yl) Pyrazine-2,5-dicarboxamide

To a solution of Example 5 (77.4 mg, 0.15 mmol) in DMF (5 mL) was added TEA (151 mg, 1.49 mmol) and 2,5-dioxypropyrrolidin-1-yl 2,5,8,11-tetraoxadecan-14-oate (113 mg, 0.34 mmol) and the reaction was stirred for 16 h at room temperature. The reaction was concentrated and the residue was purified by medium pressure reversed phase chromatography (LiChroprep RP-18 Lobar (B) 25x310 mm—EMD chemicals 40-63 \mu\text{m}, ~70 g, 90/10 to 80/20 0.1% TFA-ACN) to afford 37.4 mg (35% yield) of example 7 as an orange film: \textsuperscript{1}NMR (300 MHz, DMSO-d\textsubscript{6}) \delta 8.47 (t, J=5.7 Hz, 2H), 7.96 (t, J=5.4 Hz, 2H), 3.20-3.60 (complex m, 36 H), 3.47 (s, 3H), 3.46 (s, 3H), 2.30 (t, J=6.3 Hz, 4H), \textsuperscript{13}C NMR (75 MHz, DMSO-d\textsubscript{6}) \delta 170.2(s), 165.1(s), 146.0(s), 126.2(s), 71.2(t), 69.7(t), 69.6(t), 69.5(t), 69.4(t), 66.7(t), 58.0(q), 38.2(t), 36.2(t). LCMS (595% gradient acetonitrile in 0.1% TFA over 10 min), single peak retention time=4.01 min on 250 mm column, (M+H\textsuperscript{+})=719, (M+Na\textsuperscript{+})=741. UV/vis (100 \muM in PBS) \lambda\textsubscript{abs}=437 nm. Fluorescence (100 nM) \lambda\textsubscript{ex}=437 nm, \lambda\textsubscript{em}=559 nm.
Example 8

3,6-Diamino-N²,N⁴-bis(26-oxo-2,5,8,11,14,17,20, 23-octaoxa-27-azanonacosan-29-yl)pyrazine-2,5- dicarboxamide

To a solution of Example 5 (50.3 mg, 0.10 mmol) in DMF (5 mL) was added TEA (109 mg, 1.08 mmol) and 2,5-dioxopyrrolidin-1-yl 2,5,8,11,14,17,20,23-octaoxaheicosan-26-oate (128 mg, 0.25 mmol) and the reaction was stirred for 16 h at room temperature. The reaction was concentrated and the residue was purified by medium pressure reversed phase chromatography (LiChroprep RP-18 Lobar (B) 25x310 mm—EMD chemicals 40-63 μm, −70 g, 90/10 to 80/20 0.1% TFA-ACN) to afford 87.9 mg (82% yield) of example 8 as an orange film: ¹H NMR (300 MHz, DMSO-d₆) δ 8.46 (t, J=5.7 Hz, 2H), 7.96 (t, J=5.4 Hz, 2H), 3.16-3.73 (complex m, 74H), 2.28-2.32 (m, 2H). ¹³C NMR (75 MHz, DMSO-d₆)—multiple conformations—δ 170.1 (s), 169.9 (s) 169.8 (s), 165.1 (s), 146.0 (s), 126.2 (s), 71.2 (t), 69.7 (t), 69.6 (t), 69.5 (t), 66.7 (t), 58.0 (q), 38.2 (t), 36.2 (t). LCMS (15-95% gradient acetonitrile in 0.1% TFA over 10 min), single peak retention time=5.90 min on 250 mm column. (M+H)⁺=1071, (M+2H)²⁺=536. UV/vis (100 μM in PBS) λ_abso=438 nm, Fluorescence (100 nM) λ_em=438 nm, λ_em=560 nm.

Example 9

3,6-Diamino-N²,N⁴-bis(38-oxo-2,5,8,11,14,17,20, 23,26,29,32,35-dodecaoxa-39-azahentetracontan-41-ylpyrazine-2,5-dicarboxamide

To a solution of Example 5 (53.1 mg, 0.10 mmol) in DMF (5 mL) was added TEA (114 mg, 1.13 mmol) and 2,5-dioxopyrrolidin-1-yl 2,5,8,11,14,17,20,23,26,29,32,35-dodecaoxa-39-azahentetracontan-38-oate (144 mg, 0.21 mmol) in DMF (2.0 mL) and the resulting mixture was stirred for 16 h thereafter. The reaction was concentrated and the residue was purified by medium pressure reversed phase chromatography (LiChroprep RP-18 Lobar (B) 25x310 mm—EMD chemicals 40-63 μm, −70 g, 90110 to 80/20 0.1% TFA-ACN) to afford 87.5 mg (61% yield) of example 9 as an orange film: ¹H NMR (300 MHz, DMSO-d₆) δ 8.48 (t, J=5.7 Hz, 2H), 7.96 (t, J=5.4 Hz, 2H), 7.80-7.86 (m, 2H), 5.94 (m, 2H), 3.50-3.60 (complex m, 106 H), 2.26-2.33 (m, 41H). ¹³C NMR (75 MHz, DMSO-d₆) δ 170.2 (s), 165.1 (s), 146.0 (s), 126.2 (s), 71.2 (t), 69.7 (t), 69.6 (t), 69.5 (t), 66.7 (t), 58.0 (q), 38.2 (t), 36.2 (t). LCMS (15-95% gradient acetonitrile in 0.1% TFA over 10 min), single peak retention time=5.90 min on 250 mm column. (M+H)⁺=712. UV/vis (100 μM in PBS) λ_abso=449 nm, Fluorescence (100 nM) λ_em=449 nm, λ_em=559 nm.
Example 10

Bis(2-(PEG-5000)ethyl) 6-(2-(3,6-diamino-5-(2-aminoethyl carbamoyl)pyrazine-2-carboxamido)ethyl-aminog)6-oxohexane-1,5-diyl dicarbamate

Overall MW=1,000

A solution of Example 5 (25 mg, 0.049 mmol) in DMF (30 mL) was treated with TEA (1 mL) and m-PEG2-NHS (1 g, 0.1 mmol) and the resulting mixture was stirred for 48 h at room temperature. The mixture was concentrated and the residue was partially purified by gel filtration chromatography (G-25 resin, water). The product was concentrated and further purified by reverse phase medium pressure chromatography (C18, 10-70% amin gradient acetonitrile in 0.1% TFA) to afford 137.8 mg (54% yield) of Example 10 as a tan waxy solid: Maldi MS m/z=11393.

Example 11

(R)-2-(6-(bis(2-methoxyethyl)amino)-5-cyano-3-morpholinopyrazine-2-carboxamido) succinic Acid

Step 1 Synthesis of 2-amino-5-bromo-3,6-dichloropyrazine

A solution of 2-amino-6-chloropyrazine (25 g, 193.1 mmol) in MeOH (500 mL) was treated with NBS (34.3 g, 193.1 mmol), portion-wise, over 1 hour. The resulting mixture was stirred for 16 hours thereafter. TLC analysis at this time shows a small amount of starting material remaining. Another 1.4 g NBS added and reaction heated to 50°C for 2 hours. The mixture was then cooled to 38°C, and treated with NCS (25.8 g, 193.1 mmol). The reaction mixture was heated to 50°C for 16 hours thereafter. The mixture was then cooled to room temperature and treated with water (500 mL). The precipitate was collected by filtration and dried in a vacuum desiccator to afford 45.4 g (97% yield) of 2-amino-5-bromo-3,6-dichloropyrazine as a white solid: 13C NMR (75 MHz, CDCl3) δ 149.9 (s), 145.6 (s), 129.6 (s), 121.5 (s). LCMS (15-95% gradient acetonitrile in 0.1% TFA over 10 min), single peak retention time=4.51 min on 30 mm column, (M+H)+=244, (M+H+ACN)+=285.

Step 2. Synthesis of 5-amino-3,6-dichloropyrazine-2-carbonitrile

A mixture of CuCN (8.62 g, 96.3 mmol) and NaN (4.72 g, 96.3 mmol) was heated under high vacuum to 90°C. The resulting mixture was subjected to three Argon/Vacuum cycles and placed under a final positive pressure of Argon. The mixture was allowed to cool to room temperature and DMF (150 mL) was added. The heterogeneous mixture was heated to 130°C for 2.5 hours. To the resulting homogeneous mixture of sodium dicyanocuprate was added a solution of the product from step 1 (15.6 g, 64.2 mmol) dissolved in DMF (150 mL), dropwise, over 1 hour. The temperature was gradually raised to 150°C and the resulting mixture was stirred at this temperature for 10 hours thereafter. The reaction was then allowed to cool to room temperature and poured into water (1 L). The resulting mixture was extracted with EtOAc (3×) and the combined extracts were filtered to remove a flocculant dark solid, washed with brine, dried (Na2SO4), filtered again and concentrated. Purification by flash column chromatography (SiO2, loll hexanes-EtOAc to 3/1) to afford 6.70 g (55% yield) of the nitrile product as a tan solid: 13C NMR (75 MHz, CDCl3) δ 153.9 (s), 149.1 (s), 131.7 (s), 115.4 (s), 111.0 (s). GCMS (m/z): Retention=280°C, 1.0 mL/min helium flow rate, temperature program: 100°C (2 min hold), ramp to 300°C @ 10°C/min (2 min hold), major peak retention time=16.556 min, m/z (El)=188, 190.
Step 3. Synthesis of 5-amino-3-(bis(2-methoxyethyl)amino)-6-chloropyrazine-2-carbonitrile

To the product from step 2 (1.00 g, 5.29 mmol) in ACN (20 mL) was added bis(2-methoxyethyl)amine (3.0 mL, 2.71 g, 20.3 mmol) and the reaction mixture was heated to 70°C for 16 hours thereafter. The reaction was cooled and concentrated. The residue was partitioned with EtOAc and water. The organic layer was separated and the aqueous was extracted again with EtOAc. The combined organic extracts were washed with brine, dried (Na$_2$SO$_4$), filtered and concentrated. Purification by flash column chromatography (SiO$_2$, 10:1 hexanes:EtOAc to 1:1) afforded 950 mg (63% yield) of the desired adduct as a yellow solid: $^1$H NMR (300 MHz, CDCl$_3$) δ 7.47 (bs, 2H), 3.77 (t, J=5.7 Hz, 4H), 3.52 (t, J=5.4 Hz, 4H), 3.25 (s, 6H). $^{13}$C NMR (75 MHz, CDCl$_3$) δ 154.7 (s), 152.0 (s), 120.9 (s), 119.5 (s), 95.8 (s), 71.0 (t), 59.1 (q), 50.0 (t). LCMS (50-95% gradient acetonitrile in 0.1% TFA over 10 min), single peak retention time=4.91 min on 250 mm column, (M+H)$^+$=386, (M+Na)$^+$=398, (M+Na+ACN)$^+$=349.

Step 4. Synthesis of 3-(bis(2-methoxyethyl)amino)-5-bromo-6-chloropyrazine-2-carbonitrile

To the product from step 3 (1.39 g, 4.88 mmol) in 48% hydrobromic acid (20 mL) at 0°C (ice-salt bath), was added a solution of sodium nitrite (673 mg, 9.75 mmol) in water (10 mL) dropwise over 30 min. The resulting mixture was stirred at 0–5°C for 1 h and poured into a stirred solution of CuBr$_2$ (1.64 g, 7.34 mmol) in water (100 mL). The resulting mixture was stirred for 16 h at room temperature thereafter. The mixture was extracted with EtOAc (3×). The combined organic layers were dried (Na$_2$SO$_4$), filtered and concentrated. Purification by flash column chromatography (SiO$_2$, 50:1 CHCl$_3$:MeOH) afforded 1.00 g (58% yield) of the bromide as a orange-brown solid: $^1$H NMR (300 MHz, CDCl$_3$) δ 3.99 (t, J=5.4 Hz, 4H), 3.64 (t, J=5.4 Hz, 4H), 3.35 (s, 6H). $^{13}$C NMR (75 MHz, CDCl$_3$) δ 152.8 (s), 140.8 (s), 133.4 (s), 117.2 (s), 108.3 (s), 70.4 (t), 59.1 (t), 50.5 (q). LCMS (50-95% gradient acetonitrile in 0.1% TFA over 10 min), single peak retention time=4.55 min on 250 mm column, (M+H)$^+$=349, 351.

Step 5. Synthesis of 3-(bis(2-methoxyethyl)amino)-6-chloro-5-(4-fluran-2-y1)pyrazine-2-carbonitrile

Step 6. Synthesis of 6-(bis(2-methoxyethyl)amino)-3-chloro-5-cyanopyrazine-2-carboxylic Acid

To a well stirred mixture of ACN (11 mL), CH$_2$Cl$_2$ (7 mL), and water (11 mL) were added sodium periodate (1.07 g, 5.00 mmol) and RuO$_2$.H$_2$O (3.3 mg, 0.10 mmol), sequentially. The resulting mixture was stirred vigorously at room temperature for 30 min and treated with sodium bicarbonate (2.10 g, 25.0 mmol) followed by water (5 mL). Vigorous stirring for another 15 minutes was followed by the addition of a solution of the product from Step 5 (276 mg, 0.82 mmol) in AcCN (1 mL). The green mixture was stirred at room temperature for 5.5 h. The mixture was transferred to a separatory funnel and extracted with EtOAc. The aqueous layer was adjusted to pH 3.5 and extracted again with EtOAc (2×). The combined extracts were washed with 20% sodium bisulfite and brine and dried (Na$_2$SO$_4$). Filtration and concentration afforded 140 mg (54% yield) of carboxylic acid as a pale yellow solid. LCMS (5-95% gradient acetonitrile in 0.1% TFA over 10 min), single peak retention time=5.05 min on 250 mm column, (M+H)$^+$=315.

Step 7. Synthesis of (R)-dibenzy1 2-(6-(bis(2-methoxyethyl)amino)-3-chloro-5-cyanopyrazine-2-carboxamido)succinate

A mixture of the product from step 6 (140 mg, 0.45 mmol), EDC.HCl (128 mg, 0.67 mmol) and HOBT.H$_2$O (102 mg, 0.67 mmol) in anhydrous DMF (25 mL) was stirred together at room temperature for 30 min. To this stirred mixture was added (R)-dibenzy1 2-aminosuccinate p-TsOH salt (213 mg, 0.44 mmol) followed by TEA (1 mL). The resulting mixture was stirred for 16 h thereafter. The reaction mixture was concentrated and partitioned with EtOAc and saturated sodium bicarbonate solution. The EtOAc layer was separated and washed with saturated sodium bicarbonate and brine,
dried (Na$_2$SO$_4$), filtered and concentrated to afford 240 mg (88% yield) of the pyrazine amide as an orange foam. LCMS (15-95% gradient acetonitrile in 0.1% TFA over 10 min), single peak retention time=8.76 min on 250 mm column, (M+H)$^+$=610, (M+Na)$^+$=632.

Step 8. (R)-dibenzy 1-(6-bis[2-methoxethyl]amino)-5-cyano-3-morpholinopyrazine-2-carboxamido) succinate

\[
\begin{array}{c}
\text{H}_2\text{CO} \\
\text{OCH}_3 \\
\text{N} \\
\text{O} \\
\text{N} \\
\text{O} \\
\text{O} \\
\text{CO}_2\text{H} \\
\text{N} \\
\text{H} \\
\text{O} \\
\text{C} \\
\text{H}_3
\end{array}
\]

To the product from step 7 (240 mg, 0.39 mmol) was added morpholine (5 mL). The reaction mixture was heated to 70°C for 2 h. The mixture was cooled and concentrated. The residue was partitioned with EtOAc and water. The EtOAc layer was separated and washed with saturated sodium bicarbonate and brine. The EtOAc layer was dried (Na$_2$SO$_4$), filtered and concentrated. Purification by flash column chromatography (SiO$_2$, 3:1 to 1:1 hexanes-EtOAc) afforded 199 mg (75% yield) of the morpholine adduct as an orange foam: LCMS (15-95% gradient acetonitrile in 0.1% TFA over 10 min), single peak retention time=8.76 min on 250 mm column, (M+H)$^+$=661, (M+Na)$^+$=683.

Step 9. Synthesis of Example 11

The dibenzy ester (115 mg, 0.17 mmol) in THF (10 mL) was added 1.0 N sodium hydroxide (4 mL). The mixture was stirred for 1 h at room temperature. The pH was adjusted to 2 with 1.0 N HCl and the solution was concentrated. Purification of the residue by medium pressure reversed phase chromatography (LiChrospher RP-18 1.0bar (B) 25×310 mm—EMD Chemicals 40-63 μm, ~70 g, 90/10 to 50/50 1% TFA-ACN) afforded 32 mg (27% yield) of example 11 as an orange solid: LCMS (15-95% gradient acetonitrile in 0.1% TFA over 10 min), single peak retention time=4.47 min on 250 mm column, (M+H)$^+$=481. UV/vis (100 μm PBS) λ$_{max}$=438 nm. Fluorescence (100 nM) λ$_{exc}$=449 nm, λ$_{em}$=570 nm.

An example of an in vivo renal monitoring assembly 10 is shown in FIG. 2 and includes a light source 12 and a data processing system 14. The light source 12 generally includes or is interconnected with an appropriate device for exposing at least a portion of a patient's body to light from thereon. Examples of appropriate devices that may be interconnected or be a part of the light source 12 include, but are not limited to, catheters, endoscopes, fiber optics, ear clips, hand bands, head bands, forehead sensors, surface coils, and finger probes. Indeed, any of a number of devices capable of emitting visible and/or near infrared light of the light source may be employed in the renal monitoring assembly 10.

Still referring to FIG. 2, the data processing system 14 of the renal monitoring assembly 10 may be any appropriate system capable of detecting spectral energy and processing data indicative of the spectral energy. For instance, the data processing system 14 may include one or more lenses (e.g., to direct and/or focus spectral energy), one or more filters (e.g., to filter out undesired wavelengths of spectral energy), a photodiode (e.g., to collect the spectral energy and convert the same into electrical signal indicative of the detected spectral energy), an amplifier (e.g., to amplify electrical signal from the photodiode), and a processing unit (e.g., to process the electrical signal from the photodiode). This data processing system 14 is preferably configured to manipulate collected spectral data and generate an intensity/time profile and/or a concentration/time curve indicative of renal clearance of a pyrazine derivative of the present invention from the patient 20. Indeed, the data processing system 14 may be configured to generate appropriate renal function data by comparing differences in manners in which normal and impaired cells remove the pyrazine derivative from the bloodstream, to determine a rate or an accumulation of the pyrazine derivative in organs or tissues of the patient 20, and/or to provide tomographic images of organs or tissues having the pyrazine derivative associated therewith.

In one protocol for determining renal function, an effective amount of a pyrazine derivative of the invention is administered to the patient (e.g., in the form for a pharmaceutically acceptable composition). At least a portion of the body of the patient 20 is exposed to visible and/or near infrared light from the light source 12 as indicated by arrow 16. For instance, the light from the light source 12 may be delivered via a fiber optic that is affixed to an ear of the patient 20. The patient may be exposed to the light from the light source 12 before or after administration of the pyrazine derivative to the patient 20. In some cases, it may be beneficial to generate a background or baseline reading of light being emitted from the body of the patient 20 (due to exposure to the light from the light source 12) before administering the pyrazine derivative to the patient 20. When the pyrazine derivative that is in the body of the patient 20 is exposed to the light from the light source 12, a pyrazine derivative emanates light (indicated by arrow 18) that is detected/collected by the data processing system 14. Initially, administration of the pyrazine derivative to the patient 20 generally enables an initial spectral signal indicative of the initial content of the pyrazine derivative in the patient 20. The spectral signal then tends to decay as a function of time as the pyrazine derivative is cleared from the patient 20. This decay in the spectral signal as a function of time is indicative of the patient's renal function. For example, in a first patient exhibiting healthy/normal renal function, the spectral signal may decay back to a baseline in a time of T. However, a spectral signal indicative of a second patient exhibiting deficient renal function may decay back to a baseline in a time of T+4 hours. As such, the patient 20 may be
REFERENCES

What is claimed is:

I. A compound of Formula I, wherein:

\[ \text{Formula I} \]

X\(^1\) and X\(^2\) are independently —CO( AA); Y\(^1\) and Y\(^2\) are independently —OR\(^3\); R\(^{10}\) are independently —H, —(CH\(_2\))\(_n\)OR\(^3\); R\(^{11}\) are independently —OR\(^3\); R\(^{12}\) are independently —COOR\(^{15}\); R\(^{13}\) are independently —(CH\(_2\))\(_n\)OR\(^3\); R\(^{14}\) are independently —CH\(_3\), (CH\(_2\))OR\(^3\), —CH\(_2\)(C\(_3\)H\(_4\)O\(_2\))R\(^{16}\), —CH\(_2\)(C\(_4\)H\(_2\)O\(_2\))H, —CH\(_2\)(CH\(_2\))OR\(^3\)
The compound of claim 1, wherein the one or more α-amino acids of the polypeptide chain (AA) are selected from aspartic acid, asparagine, arginine, histidine, lysine, glutamic acid, glutamine, serine, and homoserine.

8. The compound of claim 1, wherein the one or more α-amino acids of the polypeptide chain (AA) are selected from aspartic acid, glutamic acid, serine, and homoserine.

9. The compound of claim 1, wherein the polypeptide chain (AA) is a homopolypeptide chain.

10. The compound of claim 1, wherein the polypeptide chain (AA) is a heteropolypeptide chain.

11. The compound of claim 1, wherein the polypeptide chain (AA) is aspartic acid or serine.

12. The compound of claim 2, wherein each of R_1^12 and R_1^{15} is —H.

13. The compound of claim 1, wherein each (AA) is a single natural or unnatural α-amino acid.

14. The compound of claim 2, wherein each (AA) is a single natural or unnatural α-amino acid.

15. The compound of claim 12, wherein each (AA) is a single natural or unnatural α-amino acid.

16. The compound of claim 1, wherein each (AA) is serine.

17. The compound of claim 16, wherein each of Y_1^1 and Y_2^2 is —NR_1^{12}R_1^{13}.

18. The compound of claim 17, wherein each of R_1^{12} and R_1^{13} is —H.
