ABSTRACT
Provided herein are compounds, preparations and formulations comprising pyrazine derivatives having multiple poly (ethylene glycol) containing substituents. Many of the compounds disclosed herein are excretory by the renal system of a subject or patient and are useful for visualizing the renal system of a subject or patient. Upon excitation by electromagnetic radiation, a number of the compounds disclosed herein exhibit luminescence and are externally detectable when present in the body fluid of a patient or subject. Also provided herein are methods for visualizing the renal system of a subject or patient.

CROSS REFERENCE TO RELATED APPLICATIONS

BACKGROUND

The present invention relates to pyrazine derivatives and methods of using the same in medical procedures.

As a preliminary note, various publications are referenced throughout this disclosure by Arabic numerals in brackets. A citation corresponding to each reference number is listed following the detailed description.

Acute renal failure (ARF) is a common ailment in patients admitted to general medical-surgical hospitals. Approximately half of the patients who develop ARF die, and survivors face marked increases in morbidity and prolonged hospitalization [1]. Early diagnosis is generally believed to be important, because renal failure is often asymptomatic and typically requires careful tracking of renal function markers in the blood. Dynamic monitoring of patient renal function is desirable in order to reduce the risk of acute renal failure brought about by various clinical, physiological and pathological conditions [2-6]. Such dynamic monitoring might be particularly desirable in the case of critically ill or injured patients, because a large percentage of those patients tend to face risk of multiple organ failure (MOF) potentially resulting in death [7, 8]. MOF is a sequential failure of the lungs, liver and kidneys and is incurred by one or more of acute lung injury (ALI), adult respiratory distress syndrome (ARDS), hypermetabolism, hypotension, persistent inflammatory focus and sepsis syndrome. Common histological features of hypotension and shock leading to MOF generally include tissue necrosis, vascular congestion, interstitial and cellular edema, hemorrhage and microthrombi. These changes generally affect the lungs, liver, kidneys, intestine, adrenal glands, brain, and pancreas in descending order of frequency [9]. The transition from early stages of trauma to clinical MOF generally corresponds with a particular degree of liver and renal failure as well as a change in mortality risk from about 50% up to about 75% [10].

Traditionally, renal function of a patient has been determined using crude measurements of the patient’s urine output and plasma creatinine levels [11-13]. These values may be misleading because such values are affected by age, state of hydration, renal perfusion, muscle mass, dietary intake, and many other clinical and anthropometric variables. In addition, a single value obtained several hours after sampling may be difficult to correlate with other physiologic events such as blood pressure, cardiac output, state of hydration, and other specific clinical events (e.g., hemorrhage, bacteremia, ventilator settings and others).

With regard to conventional renal monitoring procedures, an approximation of a patient’s glomerular filtration rate (GFR) may be made via a 24 hour urine collection procedure that (as the name suggests) typically requires about 24 hours for urine collection, several more hours for analysis, and a meticulous bedside collection technique. Unfortunately, the undesirably late timing and significant duration of this conventional procedure may reduce the likelihood of effectively treating the patient and/or saving the kidney(s). As a further drawback to this type of procedure, repeat data tends to be equally as cumbersome to obtain as the originally acquired data.

Occasionally, changes in serum creatinine of a patient are adjusted based on measurement values such as the patient’s urinary electrolytes and osmolarity as well as derived calculations such as “renal failure index” and/or “fractional excretion of sodium.” Such adjustments of serum creatinine undesirably tend to require contemporaneous collection of additional samples of serum and urine and, after some delay, further calculations. Frequently, dosing of medication is adjusted for renal function and thus may be equally as inaccurate, equally delayed, and as difficult to reassess as the measurement values and calculations upon which the dosing is based. Finally, clinical decisions in the critically ill population are often equally as important in their timing as they are in their accuracy.

It is known that hydrophilic, anionic substances are generally capable of being excreted by the kidneys [14]. Renal clearance typically occurs via two pathways: glomerular filtration and tubular secretion. Tubular secretion may be characterized as an active transport process, and hence, the substances clearing via this pathway typically exhibit specific properties with respect to size, charge and lipophilicity.

Most of the substances that pass through the kidneys are filtered through the glomerulus (a small intertwined group of capillaries in the malpighian body of the kidney). Examples of exogenous substances capable of clearing the kidney via glomerular filtration (hereinafter referred to as “GFR agents”) are shown in FIG. 1 and include creatinine, o-iodohippuran, and 99mTc-DTPA [15-17]. Examples of exogenous substances that are capable of undergoing renal clearance via tubular secretion include 99mTc-MAG3 and other substances known in the art [15, 18, 19]. 99mTc-MAG3 is also widely used to assess renal function though gamma scintigraphy as well as through renal blood flow measurement. As one drawback to the substances illustrated in FIG. 1, o-iodohippuran, 99mTc-DTPA and 99mTc-MAG3 include radioisotopes to enable the same to be detected. Even if nonradioactive analogs (e.g., such as an analog of o-iodohippuran) or other non-radioactive substances were to be used for renal function monitoring, such monitoring would typically require the use of undesirable ultraviolet radiation for excitation of those substances.

SUMMARY

The present invention generally relates to compounds for biomedical applications, including imaging and diagnosing medical conditions. Compounds provided absorb and emit spectral energy in the visible, near infrared, and/or any other wavelength range useful for optical detection in medical procedures. The invention includes compounds and related therapeutic methods, comprising pyrazine compounds having substituent groups which allow tailoring of the spectral properties and/or provide desired characteristics in a biological system.

In embodiments, provided are compounds and methods useful for measuring properties of the renal system, including renal excretion rate and renal function. In an aspect, the invention relates to compounds useful for rapid and in an embodiment, real-time, assessment of renal function. Compounds of the invention are generally characterized as pyrazine derivatives. Pyrazine derivatives of the invention are desirable for renal applications because they are cleared from the body via the kidneys, demonstrate strong absorption and
luminescence in useful regions of the electromagnetic spectrum and exhibit significant Stokes shifts. In an embodiment, for example, an absorption maxima of a compound of the invention is shifted a selected number of nanometers (e.g., 10-50 nm) toward the red region of the electromagnetic spectrum by selection of the composition of substituents of the central pyrazine group. These properties provide flexibility in both tuning the molecule to the desired absorption and emission wavelengths and providing substituents to improve renal clearance properties. In an aspect, pyrazine compounds of the present invention have renal clearance properties that are comparable with or better than that of creatinine or iohalate or other conventional renal clearance assessment agents.

In an aspect, the present invention is directed to pyrazine derivatives of Formula (FX1):

wherein:
R¹ and R³ are each independently —H, —(CH₃)₄
(CH₂)₄OH, R₈, —(CH₂)₆OH, R₉, —CH(CH₃)₂CH₂OH or —(CH₂)₂Y₁;
each Y₁ is independently —OR₈, —(CHOH)₆R₇, —NR₈R₉, —CONHR₁R₂, —NHCO(CHOH)R₇ or —NHCO(CH₂)₂(CH₂)₄OH;
each of R², R₄, R₅, R₆ and R₇ are independently —H or C₁₋₈ alkyl;
R₈ and R₉ are independently —H, C₁₋₃ alkyl, —(CH₂)₄
(CHOH)R₇, or —(CH₂)₂(CH₂)₄OH;
each of a and c is independently an integer selected from the range of 1 to 6;
each of p and q is independently an integer selected from the range of 0 to 120;
each of m and n is independently an integer selected from the range of 3 to 6.

In one aspect, described herein are compounds of Formula (FX1) and their pharmaceutically acceptable salts and esters. In some embodiments, each of R¹ and R³ is —CH(COOH)CH₂OH. In other embodiments, each of R¹ and R³ is —(CH₂)₄OH. In still other embodiments, each of R¹ and R³ is —H. In other embodiments, each of R¹ and R³ is —(CH₂)₄Y₁. In even other embodiments, each of R¹ and R³ is —CH₃. In still other embodiments, each of R¹ and R³ is —(CH₂)₂(CH₂)₄OH.

Still referring to compounds of Formula (FX1), in one embodiment R², R₄, R₅, R₆ and R₇ are each independently —H or C₁₋₃ alkyl. In some embodiments, each occurrence of R₈ and R₉ is independently C₁₋₃ alkyl (e.g., each occurrence of R₈ is C₁ alkyl). In some embodiments, each of R² and R₄ is —H. In other embodiments, each of R² and R₄ is independently C₁₋₃ alkyl (e.g., each of R² and R₄ is C₁ alkyl).

The integer m independently varies from 3 to 6, inclusive. For instance, in some embodiments, m may be 3 or 4 (e.g., m may be 3 in some embodiments). Likewise, the integer n independently varies from 3 to 6, inclusive. For instance, in some embodiments, n may be 3 or 4 (e.g., n may be 3 in some embodiments). One of the benefits of m and n independently varying from 3 to 6 is that the pyrazine derivative can be “tuned” to absorb or luminesce at a desired wavelength or range of wavelengths. In this regard, a pyrazine derivative having both m and n equal to 3 may absorb and/or luminesce at respective light wavelengths that are greater than (e.g., about 10-15 nm greater than) that of a generally similar pyrazine derivative where both m and n are equal to 2. A similar phenomenon could be observed moving from 3 to 4, from 4 to 5, and/or from 5 to 6. Accordingly, pyrazine derivatives described herein may be designed to absorb and/or luminesce at light wavelengths that may penetrate tissues better than that of lower light wavelengths.

Still referring to compounds of Formula (FX1), each occurrence of p and q independently varies from 0 to 120, inclusive. In some embodiments, each occurrence of p and q independently varies from 1 to 120, inclusive. For instance, in some embodiments, each of p and q independently varies from 2 to 50, inclusive. In other embodiments, each of p and q independently varies from 2 to 24, inclusive. In other embodiments, each of p and q independently varies from 1 to 99, inclusive. In other embodiments, each of p and q independently varies from 2 to 40, inclusive. In other embodiments, each of p and q independently varies from 3 to 23, inclusive. In embodiments, the number of PEG groups in a particular chain varies from 1 to 120. In other embodiments, the number of PEG groups in a particular chain varies from 2 to 50. In other embodiments, the number of PEG groups in a particular chain varies from 2 to 24.

With regard to the various possibilities for R¹ and R³ in Formula (FX1), each occurrence of a and c independently varies from 0 to 6, inclusive. For example, each occurrence of a and c may be 3 or 4 in some embodiments. Further, each occurrence of b independently varies from 1 to 120, inclusive. For instance, in some embodiments, each occurrence of b may independently vary from 2 to 50, inclusive. In embodiments, each b is independently an integer from 1 to 100. In embodiments, each b is independently an integer from 12 to 24. In embodiments, each b is independently an integer from 10 to 40. In embodiments, each b is independently an integer from 2 to 24.

In an embodiment, the invention provides compounds having formulae (FX2) to (FX3):
In an embodiment, the invention provides compounds having formulae (FX4) to (FX5):

In an embodiment, the invention provides compounds having formulae (FX6) to (FX17):
In an embodiment, the invention provides compounds having formula (FX18):

where d and h are independently integers selected from the range of 1 to 50. In an embodiment, d and h are independently integers selected from the range of 2 to 50. In an aspect of the compound of formula (FX18), each a is 2. In an aspect of the compound of formula (FX18), R^g and R^7 are each —(CH$_2$)$_a$ (CHOH)$_c$R^7$.

In an embodiment, the invention provides compounds having formula (FX19):

where d and h are independently integers selected from the range of 1 to 50. In an embodiment, d and h are independently integers selected from the range of 2 to 50. In an aspect of the compound of formula (FX19), Y^1 is —NR^gR^6 wherein R^g and R^6 are each —(CH$_2$)$_a$ (CHOH)$_c$R^7$ wherein each a is independently 1 or 2 and c is 2, 3, 4, 5 or 6.
In an embodiment, the invention provides compounds having formula (FX20):

where \( d \) and \( h \) are independently integers selected from the range of 1 to 50. In an embodiment, \( d \) and \( h \) are independently integers selected from the range of 2 to 50. In a specific aspect of the compound of formula (FX20), each \( a \) is independently 0, 2 or 3, and each \( R^2 \) is independently \( C_1-C_3 \) alkyl. In an embodiment, the invention provides compounds having formula (FX20-1) having the formula:

where each \( z \) is independently an integer selected from the range of 0 to 6.

In an embodiment, the invention provides compounds having formula (FX21):

wherein \( d \) and \( h \) are independently integers selected from the range of 1 to 50 and each \( a \) is independently an integer selected from the range of 0 to 6. In an embodiment, \( d \) and \( h \) are independently integers selected from the range of 2 to 50.

where \( d \) and \( h \) are independently integers from 1 to 50. In an embodiment, \( d \) and \( h \) are independently integers selected from the range of 2 to 50.
In an embodiment, the invention provides compounds having formula (FX23):

where \(d\) and \(h\) are independently integers selected from the range of 1 to 50. In an embodiment, \(d\) and \(h\) are independently integers selected from the range of 2 to 50.

In an embodiment, the invention provides compounds having formula (FX24):

where \(d\) and \(h\) are independently integers from 1 to 50 and each \(b\) is independently an integer selected from the range of 1 to 50. In an embodiment, \(d\) and \(h\) are independently integers selected from the range of 2 to 50.

In an embodiment, the invention provides compounds having formula (FX25):

where \(d\) and \(h\) are independently integers selected from the range of 1 to 50. In an embodiment, \(d\) and \(h\) are independently integers selected from the range of 2 to 50.

In an aspect of the invention, \(p\) and \(q\) are the same integer. In an aspect of the invention, each \(b\) appearing in a formula is the same integer. In an aspect of the invention, each \(b\) appear-
In an aspect of the invention, each b appearing in a formula is the same or different integer. In an aspect of the invention, each variable (i.e., n, b, p, q, d, h, c, m, n, etc.) is the same or different integers. In an aspect of the invention, each variable appearing in a formula is the same integer. In an aspect of the invention, each variable appearing in a formula is the same integer. In an aspect of the invention, each variable appearing in a formula is the same integer. In an aspect of the invention, each variable appearing in a formula is the same integer.

In an aspect of the invention, each variable appearing in a formula is the same integer. In an aspect of the invention, each variable appearing in a formula is the same integer. In an aspect of the invention, each variable appearing in a formula is the same integer. In an aspect of the invention, each variable appearing in a formula is the same integer. In an aspect of the invention, each variable appearing in a formula is the same integer.

In an aspect of the invention, the groups that are para to each other on the pyrazine ring are the same. In an aspect of the invention, the groups that are para to each other on the pyrazine ring are the same. In an aspect of the invention, the groups that are para to each other on the pyrazine ring are the same. In an aspect of the invention, the groups that are para to each other on the pyrazine ring are the same. In an aspect of the invention, the groups that are para to each other on the pyrazine ring are the same.

In an aspect of the invention, compounds of the invention are aminopyrazine compounds having one or more polyethylene glycol (PEG) groups. In an aspect of the invention, PEG groups add hydrophilic character to the pyrazine derivatives. As used herein, PEG groups are generally depicted by the formula: \((\text{CH}_2\text{CH}_2\text{OH})_n\) and are also known as repeating ethylene oxide groups.

In an embodiment, compounds of the invention comprise one or more branched or straight chain alkyl groups containing two or more hydroxyl groups. These groups can be referred to as “polyhydroxylated alkyl” or “polyhydroxyalkyl” groups in an embodiment. In an embodiment, the polyhydroxylated alkyl group has from three to six carbon atoms. In an embodiment, the polyhydroxylated alkyl group includes two or more \((\text{CHOH})_n\) groups along with one or more methylene groups, depicted by the formula: \((\text{CHR})_{2n}\), where \(R^1\) and \(R^2\) are each independently hydrogen, \(C_1-C_3\) alkyl or \(=O\), and \(n\) is an integer from 1 to 10. In an embodiment, the hydroxyl groups may be adjacent to each other or separated by one or more methylene groups. In an embodiment, the polyhydroxylated alkyl group refers to a substituent having from 2 to 12 carbon atoms and from 2 to 5 hydroxyl groups, such as the 2,3-dihydroxypropyl, 2,3,4-trihydroxybutyl or 2,3,4,5-tetrahydroxypentyl residue.

In an aspect of the invention, there is a three to six carbon alkylene group attached to the amino groups directly attached to the pyrazine core.

In an embodiment, compounds absorb electromagnetic radiation having wavelengths in the UVA, visible and near IR portion of the spectrum. In an embodiment, compounds of the invention absorb electromagnetic radiation between 350 to 1300 nm. In an embodiment, compounds of the invention absorb electromagnetic radiation having wavelengths between 400 to 900 nm. In an embodiment, compounds of the invention absorb electromagnetic radiation having wavelengths between 300 to 500 nm. In an embodiment, the compounds of the invention exhibit luminescence between 520 to 650 nm. In an aspect of the invention, it is desirable for the compounds to absorb and emit at longer wavelengths to enhance optical detection methods due to enhanced tissue penetration from minimized absorption from hemoglobin, water, lipids and other substances present in a biological system.

In an aspect of the invention, tetra-substituted pyrazine derivatives of the invention having PEG groups are typically hydrophilic. Increasing the number of PEG groups on the pyrazine derivatives is believed to increase the terminal halflife in circulation of the body. It is believed that lower molecular weight PEG chains (<6000 Da) are filtered by the glomerulus and not absorbed by renal tubules. These characteristics are useful in tailoring the compound to have the desired characteristics.

In an aspect of the invention, compounds of the invention have percent plasma binding of 20% or less. In an aspect of the invention, compounds of the invention have percent plasma binding of 15% or less. In an aspect of the invention, compounds of the invention have percent plasma binding of 10% or less. In an aspect of the invention, compounds of the invention have percent plasma binding of 1-10%. In an aspect of the invention, compounds of the invention have percent plasma binding of 1-15%. As used herein, “percent plasma binding” is the amount of compound that binds to plasma upon administration to a subject, such as a human subject. In an embodiment of the invention, compounds of the invention are highly cleared in the urine in a patient within a period of time of hours. In a particular embodiment, compounds of the invention are at least 80% cleared in the urine within 10 hours after administration.

In an aspect of the present invention, a compound of the invention is used in an optical imaging, biomedical imaging, diagnostic, visualization, monitoring, surgical, biomedi cal or therapeutic procedure on a patient. In an aspect of the present invention, the invention is directed to performing an optical imaging, biomedical imaging, diagnostic, visualization, monitoring, surgical, biomedical or therapeutic procedure on a patient. In an aspect of the present invention, the invention is directed to performing a biomedical imaging procedure or diagnostic procedure on a patient. In an aspect of the method comprises administering a diagnostically effective amount of the compound to a subject, wherein the compound is differentially separated from a bodily fluid of the subject by an organ, tissue or system in the subject; and detecting the administered compound. In an aspect, the compound can be detected chemically, where a sample of a bodily fluid is analyzed after administration of the compound and the concentration of the compound is measured. In an embodiment of this aspect of the invention, the compound is administered into a bodily fluid.

In an aspect of the present invention, the biomedical imaging procedure or diagnostic procedure comprises detecting electromagnetic radiation emitting or luminescing from the compound in the subject. In an aspect of the biomedical imaging procedure or diagnostic procedure of the present invention, exposing the compound administered to the subject to electromagnetic radiation changes an optical property of the compound. In an aspect of the invention, the change in optical property of the compound administered from exposure to electromagnetic radiation is measured or monitored. In an aspect of the invention, the electromagnetic radiation is nonionizing. In an aspect of the invention, exposing the administered compound to electromagnetic radiation generates luminescence from the compound, for example fluorescence. In an aspect of the invention, the procedure comprises detecting luminescence from the administered compound. In an aspect of the invention, the method comprises generating an image based, at least in part on the luminescence from the compound. In an aspect of the invention, the luminescence is collected proximate to the subject’s ear, hand, head, forehead, or finger. In an aspect of the invention, the luminescence is detected visually. In an aspect of the invention, the luminescence is detected using a camera, charged coupled device, or diode array. In an aspect of the invention, the biomedical imaging or diagnosing procedure comprises: administering an effective amount of a renally excretable compound of the invention to a subject; exposing a tissue of the subject’s renal system having the administered compound to electromagnetic radiation, thereby generating emitted electromagnetic radiation from the compound; detecting the emitted electromagnetic radiation from the compound, thereby visualizing or imaging at least a portion of the renal system of the subject.

In an aspect of the invention, the procedure comprises determining if the administered compound is substantially retained in tissue of the subject’s renal system. In an aspect of
the invention, provided is a compound described herein for use in a biomedical procedure for assessing physiological function of an organ, tissue or system. In an aspect of the invention, a compound of the invention is used in vivo in assessing renal function of a subject. In an aspect of the invention, a compound of the invention is used in vivo in detecting at least a portion of the urinary system of a subject in a surgical procedure. In an aspect of the invention, a portion of the urinary system comprises a ureter, bladder or urethra of the subject. In an aspect of the invention, a compound of the invention is administered into the bloodstream of a subject, exposed to electromagnetic radiation while in the bloodstream of the subject, and detected within the bloodstream of the subject. In an aspect of the invention, provided is a pharmaceutical composition comprising a compound of the invention and a pharmaceutically acceptable excipient. In an aspect of the invention, provided is a compound of the invention and one or more additional therapeutic agents or diagnostic agents.

The present invention further includes compositions for biomedical applications, including monitoring renal function comprising purified stereoisomers (e.g., enantiomers and diastereomers), salts (including quaternary salts), and/or ionic forms (e.g., protonated and deprotonated forms) of the compounds of any of formula (FX1)-(FX25), and mixtures thereof, and related methods of using compounds of formulae (FX1) to (FX25), for example in a biomedical procedure. As will be understood by those having general skill in the art, acidic functional groups and basic functional groups of the compounds of any of formula (FX1)-(FX25) may be in protonated or deprotonated states depending on the molecular environment (e.g., pH, ionic strength, composition, etc.), for example during synthesis, formulation and/or administration.

The present invention provides methods of making and using compounds of the invention, including specifically those shown herein, in particular compounds of formulas (FX1) to (FX25). Methods of this aspect of the present invention include in vivo, in vitro and ex vivo methods for biomedical and bianalytical applications. Methods of the present invention include photodiagnostic and phototherapeutic methods, such as optical imaging, anatomical visualization, endoscopic visualization, and image guided surgery. For some compounds for use in vivo, in vitro or ex vivo for imaging or visualizing, the tissue, organs and/or cells is a kidney, ureter, kidney cell or other portion of the renal system.

In another aspect, described herein are “kits” that include one or more compounds (or pharmaceutically acceptable salt thereof) having a formula (FX1)-(FX25) and a pharmaceutically acceptable carrier in a single package. In other words, the compound (or pharmaceutically acceptable salt thereof) and the pharmaceutically acceptable carrier are packaged together. A kit of this aspect optionally includes instructions (e.g., in the form of a paper product insert) for preparing and/or utilizing a composition that includes the compound (or pharmaceutically acceptable salt thereof) and the pharmaceutically acceptable carrier. In some embodiments, the compound (or pharmaceutically acceptable salt thereof) may have already been combined (e.g., dissolved or suspended within) the pharmaceutically acceptable carrier prior to placing the same within the packaging. In other embodiments, the compound (or pharmaceutically acceptable salt thereof) may be disposed within a first container, and the pharmaceutically acceptable carrier may be disposed within a second container that is separate and distinct from the first container. In such embodiments, the first and second containers can be found within the same packaging.

Incorporation of a combination of the substituents on the pyrazine ring is particularly beneficial for providing compounds and optical agents having large extinction coefficients in the visible and near infrared regions of the electromagnetic spectrum (e.g., 350 nm-1300 nm, optionally 400 nm to 900 nm), emission in the visible and near infrared regions (e.g., 350 nm-1300 nm, optionally 500-900 nm), a large fluorescence quantum yield (e.g., >50), and a Stokes shift useful for optical detection and imaging (e.g., Stokes shift >10 nm). For example, depending on the number of methylene groups present in the substituents linked to the pyrazine ring, the Stokes shift can be increased by 10 nm or more.

In an embodiment, provided herein are methods for a biomedical procedure, such as an imaging procedure, wherein the method comprises: (i) administering (e.g., via intravenous or intraarterial injection, oral administration, topical administration, subcutaneous administration, etc.) to a subject a diagnostically effective amount of the compound having any one of formula (FX1)-(FX25) and (ii) exposing the administered compound to electromagnetic radiation. In an embodiment, the administering step is carried out under conditions sufficient for contacting the compound with a bodily fluid of the subject, wherein the compound is differentially separated from the bodily fluid of the subject by an organ, tissue or system in the subject.

In an embodiment, exposing the administered compound to electromagnetic radiation generates a diagnostically effective amount of luminescence, for example an amount of luminescence allowing for optical detection, visualizing and/or imaging of the compound. In an embodiment, a method of the invention further comprises exposing the administered compound to electromagnetic radiation having sufficient power, fluence, intensity and/or dose (net number of photons provided to the target tissue) to provide optical detection, visualization and/or imaging of the compound. In an embodiment, a method of the invention further comprises generating an image of the luminescence from the compound. In an embodiment, a method of the invention further comprises visualizing the luminescence from the compound.

In an embodiment, the electromagnetic radiation exposed to the compound of any one of formulas (FX1)-(FX25) does not have wavelengths in the X-ray region of the electromagnetic spectrum. In an embodiment, the electromagnetic radiation exposed to the compound of any one of formulas (FX1)-(FX25) does not have wavelengths in the ultraviolet region of the electromagnetic spectrum.

As used herein, pyrazine compounds or derivatives of the present invention include a substituted pyrazine group. For example, the invention provides a pyrazine compound of the Formula A:

(Formula A)

where the R variables depict “tails” or substituent groups and are further defined and described herein. In a specific embodiment, pyrazine compounds or derivatives of the present invention include the structure shown in Formula B:
where the R variables are further defined and described herein.

In another aspect, the present invention provides methods for visualizing body fluids, organs or tissues of a subject. A method of this aspect comprises the steps of: administering to a subject an effective amount of a compound disclosed herein, for example any of the compounds having formulas (FX1)-(FX25), and detecting the compound in a body fluid, organ or tissue of the subject. In embodiments, the compound is administered to the subject intravenously, by intraperitoneal or subcutaneous injection or infusion, by oral administration, by transdermal absorption through the skin, by inhalation, by parenteral administration or by any combination of these. In a specific embodiment, the compound is excreted by the subject's renal system, for example from one body fluid (e.g., blood) into another body fluid (e.g., urine).

In specific embodiments, the step of detecting the compound comprises exposing the compound in the body fluid, organ or tissue to electromagnetic radiation, for example having wavelengths selected in the range of 350 to 1300 nm, 400 to 900 nm or 300 to 500 nm. For certain embodiments, upon excitation by electromagnetic radiation of suitable wavelength, the compounds in the body fluid, organ, tissue or system exhibit detectable luminescence, for example luminescence having wavelengths selected in the range of 350 nm to 1300 nm, 500 to 900 nm or 520 to 650 nm. In embodiments, the compounds are detected in the body fluid, organ or tissue of the subject visually (e.g., by eye) or by a camera, charged coupled device, or diode array. In a specific embodiment, the compounds are detected proximate to the subject's ear, hand, head, forehead, or finger.

Another method of this aspect comprises the steps of: administering to a subject an effective amount of a compound disclosed herein, for example any of the compounds having formulas (FX1)-(FX25), and detecting the compound in a body fluid, organ or tissue of the subject during a surgical procedure. In a specific embodiment, the compound in the body fluid, organ or tissue is exposed to electromagnetic radiation, thereby generating luminescence which is subsequently detected, for example visually or by a camera, charged coupled device, or diode array. These and other methods are useful, for example, as they can indicate to a surgeon which body fluids, organs or tissues contain the administered compound.

Without wishing to be bound by any particular theory, there can be discussion herein of beliefs or understandings of underlying principles or mechanisms relating to the invention. It is recognized that regardless of the ultimate correctness of any explanation or hypothesis, an embodiment of the invention can nonetheless be operative and useful.

FIG. 2 provides a synthetic scheme for preparation of compounds of the present invention.

FIG. 3 provides a synthetic scheme for preparation of compounds of the present invention.

FIG. 4 provides a synthetic scheme for preparation of compounds of the present invention.

FIG. 5 illustrates a block diagram of an assembly for assessing renal function.

FIG. 6 provides a schematic diagram of a monitoring device of the present invention.

FIG. 7 illustrates an apparatus for non-invasive in vivo detection of fluorescence.

FIG. 8A provides a plot showing non-invasive in vivo fluorescence signal as a function of time after delivery of a renally excretable compound. FIG. 8B provides a plot showing invasive PK (plasma concentration) as a function of time after delivery of a renally excretable compound.

FIG. 9 provides the plots of FIGS. 8A and 8B plotted versus one another to display a linear correlation between the optical and plasma pharmacokinetics.

DETAILED DESCRIPTION

Referring to the drawings, like numerals indicate like elements and the same number appearing in more than one drawing refers to the same element. In general the terms and phrases used herein have their art-recognized meaning, which can be found by reference to standard texts, journal references and contexts known to those skilled in the art. The following definitions are provided to clarify their specific use in the context of the invention.

“Optical agent” generally refers to compounds, compositions, preparations, and/or formulations that absorb, emit, or scatter electromagnetic radiation of wavelength, generally in the range of 350-1300 nanometers, within a biologically relevant environment or condition. In some embodiments, optical agents of the invention, when excited by electromagnetic radiation, undergo emission of luminescence such as fluorescence or phosphorescence pathways. These pathways are useful for diagnostic imaging, visualization, or organ function monitoring. Compounds belonging to this class are commonly referred to as ‘optical imaging agents’ or ‘optical contrast agents. In an embodiment, an optical agent is a compound described herein.

Optical agents of the present invention can contain fluorophores. The term “fluorophore” generally refers to a component or moiety of a molecule which causes a molecule to be fluorescent. Fluorophores can be functional groups in a molecule which absorb electromagnetic radiation of first specific wavelengths and re-emit energy at second specific wavelengths. The amount and wavelengths of the emitted electromagnetic radiation depend on both the fluorophore and the chemical environment of the fluorophore.

Compounds and compositions of the invention provide optical agents including imaging agents and detectable agents; and conjugates, complexes, and derivatives thereof. Some optical agents of the invention provide detectable agents that can be administered to a subject and subsequently detected using a variety of optical techniques, including optical imaging, visualization, and one-, two-, three- and point optical detection.
Optical agents include, but are not limited to, imaging agents, detectable agents and conjugates, complexes, and derivatives thereof.

When used herein, the terms “diagnosis”, “diagnostic” and other root word derivatives are as understood in the art and are further intended to include a general monitoring, characterizing and/or identifying a state of health or disease. The term is meant to encompass the concept of diagnosis. For example, the diagnosis of acute renal failure can include an initial determination and/or one or more subsequent assessments regardless of the outcome of a previous finding. The term does not necessarily imply a defined level of certainty regarding the prediction of a particular status or outcome.

As defined herein, “administering” means that a compound or formulation thereof of the invention, such as an optical agent, is provided to a patient or subject, for example in a diagnosably effective amount. The invention includes methods for a biomedically psychological wherein a diagnostically effective amount of a compound having any one of formulas (I) or (II) is administered to a patient in need of diagnosis, for example to a patient suspected of having a disorder in the renal system. Administering may be carried out by a range of techniques known in the art including intravenous, intraperitoneal or subcutaneous injection or infusion, oral administration, transdermal absorption through the skin, or by inhalation.

Alkyl groups include straight-chain, branched and cyclic alkyl groups. Alkyl groups include those having from 1 to 30 carbon atoms. Alkyl groups include small alkyl groups having 1 to 3 carbon atoms. Alkyl groups include medium length alkyl groups having from 4 to 10 carbon atoms. Alkyl groups include long alkyl groups having more than 10 carbon atoms, particularly those having 10-20 carbon atoms. Cyclic alkyl groups include those having one or more rings. Cyclic alkyl groups include those in which a double bond is in the ring or in an alkyl group attached to a ring. Cyclic alkyl groups include those having a 3-, 4-, 5-, 6-, 7-, 8-, 9- or 10-member carbon ring and particularly those having a 3-, 4-, 5-, 6-, 7-member ring. The carbon rings in cyclic alkyl groups can also carry alkyl groups. Cyclic alkyl groups can include bicyclic and tricyclic alkyl groups. Alkyl groups are optionally substituted. Substituted alkyl groups include among others those which are substituted with aryl groups, which in turn can be optionally substituted. Specific alkyl groups include methyl, ethyl, n-propyl, isopropyl, cyclopropyl, n-butyl, s-butyl, t-butyl, cyclobutyl, n-pentyl, branched-pentyl, cyclopentyl, n-hexyl, branched hexyl, and cyclohexyl groups, all of which are optionally substituted. Substituted alkyl groups include fully halogenated or semihalogenated alkyl groups, such as alkyl groups having one or more hydrogens replaced with one or more fluorine atoms, chlorine atoms, bromine atoms and/or iodine atoms. Substituted alkyl groups include fully fluorinated or semihalogenated alkyl groups, such as alkyl groups having one or more hydrogens replaced with one or more fluorine atoms. An alkoxy group is an alkyl group that has been modified by linkage to oxygen and can be represented by the formula R—O and may also be referred to as an alkyl ether group. Examples of alkoxy groups include, but are not limited to, methoxy, ethoxy, propoxy, butoxy and hexyloxy. Alkoxy groups include substituted alkoxy groups wherein the alkyl portion of the groups is substituted as provided herein in connection with the description of alkyl groups. As used herein MeO— refers to CH₃O—.

Alkenyl groups include straight-chain, branched and cyclic alkenyl groups. Alkynyl groups include those having 1, 2 or more double bonds and those in which two or more of the double bonds are conjugated double bonds. Alkynyl groups include those having from 2 to 20 carbon atoms. Alkenyl groups include small alkenyl groups having 2 to 3 carbon atoms. Alkenyl groups include medium length alkenyl groups having from 4-10 carbon atoms. Alkenyl groups include long alkenyl groups having more than 10 carbon atoms, particularly those having 10-20 carbon atoms. Cyclic alkenyl groups include those having one or more rings. Cyclic alkenyl groups include those in which a double bond is in the ring or in an alkenyl group attached to a ring. Cyclic alkenyl groups include those having a 3-, 4-, 5-, 6-, 7-, 8-, 9- or 10-member carbon ring and particularly those having a 3-, 4-, 5-, 6- or 7-member ring. The carbon rings in cyclic alkenyl groups can also carry alkenyl groups. Cyclic alkenyl groups can include bicyclic and tricyclic alkenyl groups. Alkenyl groups are optionally substituted. Substituted alkenyl groups include among others those which are substituted with alkyl or aryl groups, which groups in turn can be optionally substituted. Specific alkenyl groups include ethenyl, prop-1-enyl, prop-2-enyl, cycloprop-1-enyl, but-1-enyl, but-2-enyl, cyclobut-1-enyl, cyclobut-2-enyl, pent-1-enyl, pent-2-enyl, branched pentenyl, cyclopent-1-enyl, hex-1-enyl, branched hexenyl, cyclohexenyl, all of which are optionally substituted. Substituted alkenyl groups include fully halogenated or semihalogenated alkenyl groups, such as alkenyl groups having one or more hydrogens replaced with one or more fluorine atoms, chlorine atoms, bromine atoms and/or iodine atoms. Substituted alkenyl groups include fully fluorinated or semihalogenated alkenyl groups, such as alkenyl groups having one or more hydrogens replaced with one or more fluorine atoms. Aryl groups include having one or more 5-, 6- or 7-member aromatic or heterocyclic aromatic rings. Aryl groups can contain one or more fused aromatic rings. Heterocyclic aromatic rings can include one or more N, O, or S atoms in the ring. Heterocyclic aromatic rings can include those with one, two or three N, those with one or two O, and those with one or two S, or combinations of one or two or three N, O or S. Aryl groups are optionally substituted. Substituted aryl groups include among others those which are substituted with alkyl or alkenyl groups, which groups in turn can be optionally substituted. Specific aryl groups include phenyl groups, biphenyl groups, pyridinyl groups, and naphthyl groups, all of which are optionally substituted. Substituted aryl groups include fully halogenated or semihalogenated aryl groups, such as aryl groups having one or more hydrogens replaced with one or more fluorine atoms, chlorine atoms, bromine atoms and/or iodine atoms. Substituted aryl groups include fully fluorinated or semihalogenated aryl groups, such as aryl groups having one or more hydrogens replaced with one or more fluorine atoms. Aryl groups include, but are not limited to, aromatic group-containing or heterocyclic aromatic group-containing groups corresponding to any one of the following benzene, naphthalene, naphthoquinone, dihydroquinone, fluorene, anthracene, anthraquinone, phenanthrene, tetracene, naphtacenedione, pyridine, quinoline, isoquinoline, indoles, isoindole, pyrrole, imidazole, oxazole, thiazole, pyrazole, pyrazine, pyrimidine, purine, benzimidazole, furan, benzofuran, dibenzofuran, carbazole, acridine, acridone, phenanthridine, thiophene, benzothiophene, dibenzothiophene, xanthene, xanthone, flavone, coumarin, azulene or anthracene. As used herein, a group corresponding to the groups listed above expressly includes an aromatic or heterocyclic aromatic radical, including monovalent, divalent and polyvalent radicals, of the aromatic and heterocyclic aromatic groups listed above provided in a covalently bonded configuration in the compounds of the invention. Aryl groups optionally have one or more aromatic rings or heterocyclic aromatic rings having one or more electron donating groups, electron withdrawing groups and/or other ligands provided as substituents.
Aryalkyl groups are alkyl groups substituted with one or more aryl groups wherein the alkyl groups optionally carry additional substituents and the aryl groups are optionally substituted. Specific aryl groups are phenyl-substituted alkyl groups, e.g., phenylmethyl groups. Alkylaryl groups are alternatively described as aryl groups substituted with one or more alkyl groups wherein the alkyl groups optionally carry additional substituents and the aryl groups are optionally substituted. Specific arylalkyl groups are alkyl-substituted phenyl groups such as methylphenyl. Substituted arylalkyl groups include fully halogenated or semihalogenated arylalkyl groups, such as aryalkyl groups having one or more alkyl and/or aryl having one or more hydrogens replaced with one or more fluorine atoms, chlorine atoms, bromine atoms and/or iodine atoms.

Optional substitution of any alkyl, aryl and aryl groups includes substitution with one or more of the following substituents: halogen, —CN, —COOR, —OR, —COR, —OCOR, —CON(R)₂, —OCON(R)₂, —N(R)₂, —NO₂, —SR, —SO₂R, —SO₃N(R)₂ or —SOR groups. Optional substitution of aryl groups includes substitution with one or more alkyl groups, aryl groups or both, wherein the aryl groups and/or aryl groups are optionally substituted. Optional substitution of aryl groups includes substitution with one or more alkyl groups, aryl groups, or both, wherein the aryl groups or aryl groups are optionally substituted. Optional substitution of aryl groups includes substitution of the aryl ring with one or more alkyl groups, aryl groups, or both, wherein the aryl groups or aryl groups are optionally substituted.

Optional substituents for alkyl, aryl and aryl groups include among others:
— COOR where R is a hydrogen or an alkyl group or an aryl group and more specifically where R is methyl, ethyl, propyl, butyl, or phenyl groups all of which are optionally substituted;
— COR where R is a hydrogen, or an alkyl group or an aryl group and more specifically where R is methyl, ethyl, propyl, butyl, or phenyl groups all of which groups are optionally substituted;
— CON(R)₂, where each R, independently of each other R, is a hydrogen or an alkyl group or an aryl group and more specifically where R is methyl, ethyl, propyl, butyl, or phenyl groups all of which groups are optionally substituted; R and R can form a ring which may contain one or more double bonds;
— OCON(R)₂, where each R, independently of each other R, is a hydrogen or an alkyl group or an aryl group and more specifically where R is methyl, ethyl, propyl, butyl, or phenyl groups all of which groups are optionally substituted; R and R can form a ring which may contain one or more double bonds;
— N(R)₂, where each R, independently of each other R, is a hydrogen, or an alkyl group, acyl group or an aryl group and more specifically where R is methyl, ethyl, propyl, butyl, or phenyl or acetyl groups all of which are optionally substituted; R and R can form a ring which may contain one or more double bonds;
— SR, —SO₂R, or —SOR where R is an alkyl group or an aryl group and more specifically where R is methyl, ethyl, propyl, butyl, phenyl groups all of which are optionally substituted; for — SR, R can be hydrogen;
— OCOR where R is an alkyl group or an aryl group; —SO₃N(R), where R is a hydrogen, an alkyl group, or an aryl group and R and R can form a ring;
— OR where R is H, alkyl, aryl, or acyl; for example, R can be an acyl yielding —OCOR* where R* is a hydrogen or an alkyl group or an aryl group and more specifically where R* is methyl, ethyl, propyl, butyl, or phenyl groups all of which groups are optionally substituted.

As used herein, the term “alkyl” refers to a divalent radical derived from an alkyl group as defined herein. Alkyl groups in some embodiments function as attaching and/or spacer groups in the present compositions. Compounds of the invention include substituted and unsubstituted C₁₋₂₀ alkylene, C₁₋₁₀ alkylene and C₁₋₅ alkylene groups.

As used herein, the term “cycloalkylene” refers to a divalent radical derived from a cycloalkyl group as defined herein. Cycloalkylene groups in some embodiments function as attaching and/or spacer groups in the present compositions. Compounds of the invention include substituted and unsubstituted C₁₋₂₀ cycloalkylene, C₁₋₁₀ cycloalkylene and C₁₋₅ cycloalkylene groups.

As used herein, the term “alkylene” refers to a divalent radical derived from an alkylene group as defined herein. Alkylene groups in some embodiments function as attaching and/or spacer groups in the present compositions. Compounds of the invention include substituted and unsubstituted C₁₋₂₀ alkylene, C₁₋₁₀ alkylene and C₁₋₅ alkylene groups.

As used herein, the term “cycloalkenylene” refers to a divalent radical derived from a cycloalkaenyl group as defined herein. Cycloalkenylene groups in some embodiments function as attaching and/or spacer groups in the present compositions. Compounds of the invention include substituted and unsubstituted C₁₋₂₀ cycloalkenylene, C₁₋₁₀ cycloalkenylene and C₁₋₅ cycloalkenylene groups.

As used herein, the term “alkenylene” refers to a divalent radical derived from an alkyl group as defined herein. Alkenylene groups in some embodiments function as attaching and/or spacer groups in the present compositions. Compounds of the invention include substituted and unsubstituted C₁₋₂₀ alkenylene, C₁₋₁₀ alkenylene and C₁₋₅ alkenylene groups.

As used herein, the term “halo” refers to a halogen group such as a fluoro (—F), chloro (—Cl), bromo (—Br), iodo (—I) or astato (—At).

As used herein, the term “azo” refers to a group having at least one — N=N — moiety. Azo groups include cyclic and acyclic groups having an — N=N — moiety for example: (i) aryl-azo groups having an — N=N — moiety directly or indirectly linked to one or more carbocyclic or heterocyclic aromatic rings of a C₅₋₂₀ aryl, (ii) alkyl-azo groups having an — N=N — moiety directly or indirectly linked to one or more alkyl groups and (iii) alkaryl-azo groups having an — N=N — moiety directly or indirectly linked to one or more carbocyclic or heterocyclic aromatic rings of a C₅₋₂₀ aryl. In an embodiment, for example, an azo group of a compound of the invention includes a cyclic group having an intrin-ring — N=N — group. In an embodiment, for example, an azo group of a compound of the invention includes a cyclic group wherein a carbon-carbon bond in a carbocyclic or heterocyclic ring is replaced with a nitrogen-nitrogen double bond (i.e. N=N). In an embodiment, for example, an azo compound of the invention includes a fused ring structure comprising one or more aromatic groups and one or more acyclic groups, wherein a carbon-carbon bond in a carbocyclic or heterocyclic ring of the acyclic group is replaced with a nitrogen-nitrogen double bond (i.e. N=N).

The term “heterocyclic” refers to ring structures containing at least one other kind of atom, in addition to carbon, in the ring. Examples of such atoms include nitrogen, oxygen and sulfur. Examples of heterocyclic rings include, but are not limited to, pyrrolidinyl, piperidyl, imidazolidinyl, tetrahydro-
furyl, tetrahydrothienyl, furyl, thienyl, pyridyl, quinolyl, iso-quinolyl, pyridazinyl, pyrazinyl, indolyl, imidazolyl, oxazolyl, thiazolyl, pyrazolyl, pyridinyl, benzoaxazolyl, benzoimidazolyl, triazolyl and tetrazolyl rings.

The term carboxylic refers to ring structures containing only carbon atoms in the ring. Carbon atoms of carboxylic rings may be bonded to a wide range of other atoms and functional groups.

Allicyclic refers to a ring that is not an aromatic ring. Allicyclic rings include both carboxylic and heterocyclic rings.

Alkoxycarbonyl: As used herein, the term “alkoxycarbonyl” refers to a substituent of the formula alkyl-O-alkyl.

Polyalkoxyalkyl: As used herein, the term “polyalkoxyalkyl” refers to a substituent of the formula alkyl-(alkoxy)n, alkoxy wherein n is an integer from 1 to 10, preferably 1 to 4, and more preferably for some embodiments 1 to 3.

As used herein, the term “luminescence” refers to the emission of electromagnetic radiation from excited electronic states of atoms or molecules. Luminescence generally refers to electromagnetic radiation emission, such as photoluminescence, chemiluminescence, and electrochemiluminescence, among others. In photoluminescence, including fluorescence and phosphorescence, the excited electronic state is created by the absorption of electromagnetic radiation. Luminescence detection involves detection of one or more properties of the luminescence or associated luminescence process. These properties may include intensity, excitation and/or emission spectrum, polarization, lifetime, and energy transfer, among others. These properties may also include time-independent (steady-state) and/or time-dependent (time-resolved) properties of the luminescence. Representative luminescence techniques include fluorescence intensity (FLINT), fluorescence polarization (FP), fluorescence resonance energy transfer (FRET), fluorescence lifetime (FLT), total internal reflection fluorescence (TIRF), fluorescence correlation spectroscopy (FCS), fluorescence recovery after photobleaching (FRAP), and bioluminescence resonance energy transfer (BRET), among others. By way of example, when an optical agent is used in the present invention, it is desirable that the wavelength of non-ionizing radiation be such that it excites the optical agent. This excitation causes a bond of the molecule to break thus releasing an appropriate radical. This excitation may also cause the molecule to emit part of the absorbed energy at a different wavelength; such emission may be detected using fluorimetric techniques as described above. One skilled in the art can readily determine the most appropriate optional detection technique based, at least in part, the specific agent(s) administered and/or the particular use (e.g., area to be imaged).

As used herein, the term “controlled-release component” refers to an agent that facilitates the controlled-release of a compound including, but not limited to, polymers, polymer matrices, gels, permeable membranes, liposomes, microspheres, or the like, or any combination thereof. Methods for producing compounds in combination with controlled-release components are known to those of skill in the art.

As used herein, the term “pharmacologically acceptable” means approved by a regulatory agency of an appropriate federal or state government or listed in the U.S. Pharmacopoeia or other generally recognized pharmacopoeia for use in animals, and more particularly in humans or does not impart significant deleterious or undesirable effect on a subject to whom it is administered and in the context in which it is administered.

As is customary and well known in the art, hydrogen atoms in formulas (FX1)-(FX25) are not always explicitly shown, for example, hydrogen atoms bonded to the carbon atoms of aromatic and alicyclic rings are not always explicitly shown in formulas (FX1)-(FX25). The structures provided herein, for example in the context of the description of formulas (FX1)-(FX25), are intended to convey to one of reasonable skill in the art the chemical composition of compounds of the methods and compositions of the invention, and as will be understood by one of skill in the art, the structures provided do not indicate the specific bond angles between atoms of these compounds.

Specific substituted alkyl groups include haloalkyl groups, particularly trihalomethyl groups and specifically trifluoromethyl groups. Specific substituted aryl groups include mono-, di-, tri-, tetra- and penthalo-substituted phenyl groups; mono-, di-, tri-, tetra-, penta-, hexa-, and hepta-halo-substituted naphthalene groups; 3- or 4-halo-substituted phenyl groups; 3- or 4-alkyl-substituted phenyl groups, 3- or 4-alkoxy-substituted phenyl groups, 3- or 4-RCO-substituted phenyl, 5- or 6-halo-substituted naphthalene groups. More specifically, substituted aryl groups include acetylphenyl groups, particularly 4-acetylphenyl groups; fluorophenyl groups, particularly 3-fluorophenyl and 4-fluorophenyl groups; chlorophenyl groups, particularly 3-chlorophenyl and 4-chlorophenyl groups; methylphenyl groups, particularly 4-methylphenyl groups, and methoxyphenyl groups, particularly 4-methoxyphenyl groups.

As to any of the above groups which contain one or more substituents, it is understood that such groups do not contain any substitution or substitution patterns which are sterically impractical and/or synthetically non-feasible. In addition, the compounds of this invention include all stereoisomers arising from the substitution of these compounds.

Pharmacologically acceptable salts comprise pharmaceutically acceptable anions and/or cations. As used herein, the term “pharmacaceutically acceptable salt” can refer to acid addition salts or base addition salts of the compounds in the present disclosure. A pharmaceutically acceptable salt is any salt which retains at least a portion of the activity of the parent compound and does not impart significant deleterious or undesirable effect on a subject to whom it is administered and in the context in which it is administered. Pharmaceutically acceptable salts include metal complexes and salts of both inorganic and organic acids. Pharmaceutically acceptable salts include metal salts such as aluminum, calcium, iron, magnesium, manganese and complex salts. Pharmaceutically acceptable salts include, but are not limited to, acid salts such as acetic, aspartic, alkylsulfonic, arylsulfonic, aminol, benzenesulfonic, benzoic, bicarbonic, bisulfuric, bitartaric, butyric, calcium edetate, camsylic, carbonic, chlorobenzoic, -cilexetil, citric, edetic, edisylate, estolic, esyl, esyl, formic, fumaric, gluconic, gluconate, glutamic, glycolic, glycylglycinic, hexamic, hexyresorcinic, hydramin, hydrobromic, hydrochloric, hydroiodic, hydroxyacetic, isethionic, lactic, lactobionic, maleic, malic, maneric, mandelic, methanesulfonic, methylsuccinic, methylsulfuric, muic, muconic, napsylate, nitric, oxalic, p-nitromethanesulfonic, pamoic, pantothentic, phosphoric, monohydrogen phosphoric, dihydrogen phosphoric, phthalic, polyglycolactonic, propionic, salicylic, stearic, succinic, sulfamic, sulfanilic, sulfonic, sulfuric, tannic, tartaric, teocallic, toluenesulfonic, and the like. Pharmaceutically acceptable salts may be derived from amino acids, including but not limited to cysteine. Other pharmaceutically acceptable salts may be found, for example, in Stahl et al., Handbook of Pharmaceutical Salts Properties, Selection, and Use, Wiley-VCH; Verlag Helvetica Chimica Acta, Zurich, 2002, (ISBN 3-527-30639-0: 26-8). Pharmaceutically acceptable cations include among others, alkali metal
cations (e.g., Li⁺, Na⁺, K⁺), alkaline earth metal cations (e.g., Ca²⁺, Mg²⁺), non-toxic heavy metal cations (e.g., Cd²⁺) and substituted ammonium (NH₄⁺) and substituted ammonium (N(R')₄⁺, where R' is hydrogen, alkyl, or substituted alkyl, i.e., including, methyl, ethyl, or hydroxyethyl, specifically, trimethyl ammonium, triethyl ammonium, and triethanol ammonium cations). Pharmaceutically-acceptable anions include among other halides (e.g., so, sulfate, acetates (e.g., acetate, trifluoroacetate), ascorbates, aspartates, benzoates, citrates, and lactate.

The compounds of this invention may contain one or more chiral centers. Accordingly, this invention is intended to include racemic mixtures, diasteromers, enantiomers, tautomers and mixtures enriched in one or more stereoisomer. The scope of the invention as described and claimed encompasses the racemic forms of the compounds as well as the individual enantiomers and non-racemic mixtures thereof.

Before the present methods are described, it is understood that this invention is not limited to the particular methodology, protocols and reagents described, as these may vary. It is also to be understood that the terminology used herein is for the purpose of describing particular embodiments only, and is not intended to limit the scope of the invention which will be limited only by the appended claims.

In certain embodiments, the invention encompasses administering optical agents useful in the invention to a patient or subject. A “patient” or “subject”, used equivalently herein, refers to a mammal, preferably a human. The subject may either: (1) have a condition diagnosable by administration of an optical agent of the invention; or (2) is susceptible to a condition that is diagnosable by administering an optical agent of this invention. The patient may also be involved in a surgical procedure for treatment of a separate disorder.

Compositions of the invention includes formulations and preparations comprising one or more of the present optical agents provided in an aqueous solution, such as a pharmaceutically acceptable formulation or preparation. Optionally, compositions of the invention further comprise one or more pharmaceutically acceptable surfactants, buffers, electrolytes, salts, carriers, binders, coatings, preservatives and/or excipients.

In an embodiment, the invention provides a pharmaceutical formulation having an active ingredient comprising a composition of the invention, such as a compound of any one of formulas (FX1)-(FX25). In an embodiment, the invention provides a method of synthesizing a composition of the invention or a pharmaceutical formulation thereof, such as a compound of any one of formulas (FX1)-(FX25). In an embodiment, a pharmaceutical formulation comprises one or more excipients, carriers, diluents, and/or other components as would be understood in the art. Preferably, the components meet the standards of the National Formulary (“NF”), United States Pharmacopeia (“USP”); United States Pharmacopeial Convention Inc., Rockville, Md.), or Handbook of Pharmaceutical Manufacturing Formulations (Sarfaraz K. Niazi, all volumes, ISBN: 9780849317521, ISBN 10: 0849317525; CRC Press, 2004). See, e.g., United States Pharmacopeia and National Formulary (USP 30-NF 25), Rockville, Md.: United States Pharmacopel Convention; 2007; and 2008, and each of any earlier editions; The Handbook of Pharmaceutical Excipients, published jointly by the American Pharmacist Association and the Pharmaceutical Press (Pharmacopel Press (2005) ISBN-10: 0853696187, ISBN-13: 978-0853696186); Merck Index, Merck & Co., Rahway, N.J.; and Gilman et al., (eds) (1996); Goodman and Gilman’s: The Pharmacological Basis of Therapeutics, 8th Ed., Pergamon Press. In embodiments, the formulation base of the formulation comprises pharmaceutically acceptable excipients, namely, at least one binder and optionally other pharmaceutically acceptable excipients.

In an embodiment, an effective amount of a composition of the invention is a “diagnostically effective amount.” As used herein, the phrase “diagnostically effective” qualifies the amount of compound administered in diagnosis, for example of a disease state or other pathological condition. The amount achieves the goal of being detectable while avoiding adverse side effects found with higher doses. In an embodiment, an active ingredient or other component is included in a therapeutically acceptable amount. In an embodiment, an active ingredient or other component is included in a pharmaceutically acceptable amount.

Variations on compositions including salts and ester forms of compounds: Compositions of this invention and compounds useful in the methods of this invention include those of the compounds and formula(s) described herein and pharmaceutically-acceptable salts and esters of those compounds. In embodiments, salts include any salts derived from the acids of the formulas herein which acceptable for use in human or veterinary applications. In embodiments, the term esters refers to hydroxyal esters of compounds of the names and structural formulas herein. In embodiments, salts and esters of the compounds of the formulas herein can include those which have the same or better therapeutic, diagnostic, or pharmaceutical (human or veterinary) general properties as the compounds of the formulas herein. In an embodiment, a composition of the invention is a compound or salt or ester thereof suitable for pharmaceutical formulations.

In an embodiment, the invention provides a method for diagnosing a medical condition comprising administering to a subject (e.g. patient) in need thereof, a diagnostically effective amount of a composition of the invention, such as a compound of any one of formula (FX1)-(FX25). In an embodiment, the medical condition is acute renal failure or various other diseases, injuries, and disorders, including renal system disorders such as declining renal function, liver failure, renal failure, and failure of one or more organs or aspects of the renal system.

In an embodiment, the invention provides a medicament which comprises a diagnostically effective amount of one or more compositions of the invention. In an embodiment, the invention provides a method for making a medicament for diagnosis or aiding in the diagnosis of a condition described herein. In an embodiment, the invention provides the use of one or more compositions set forth herein for the making of a medicament.

In accordance with the present invention, one protocol for assessing physiological function of body cells includes administering an effective amount of a compound represented by Formula (FX1) to a patient. An appropriate dosage of the compound that is administered to a patient is readily determinable by one of ordinary skill in the art and may vary according to the clinical procedure contemplated, generally ranging from about 1 nanomolar to about 100 micromolar. The administration of the compound to the patient may occur in any of a number of appropriate fashions including, but not limited to: (1) intravenous, intraperitoneal, or subcutaneous injection or infusion; (2) oral administration; (3) transdermal absorption through the skin; and (4) inhalation.
Compounds of this invention may be administered as solutions in most pharmaceutically acceptable intravenous carriers known in the art. Pharmaceutically acceptable carriers that are well known to those skilled in the art include, but are not limited to, 0.01-0.1 M phosphate buffer or 0.8% saline. Additionally, pharmaceutically acceptable carriers may be aqueous or non-aqueous solutions, suspensions, emulsions, or appropriate combinations thereof. Examples of non-aqueous solvents are propylene glycol, polyethylene glycol, vegetable oils such as olive oil, and injectable organic esters such as ethyl oleate. Examples of aqueous carriers are water, alcoholic/aqueous solutions, emulsions or suspensions, including saline and buffered media. Exemplary parenteral vehicles include sodium chloride solution, Ringer’s dextrose, dextrose and sodium chloride, lactated Ringer’s or fixed oils. Exemplary intravenous vehicles include fluid and nutrient replenishers, electrolyte replenishers such as those based on Ringer’s dextrose, and the like. Preservatives and other additives may also be present, such as, for example, antimicrobials, antioxidants, collagen agents, inert gases, and the like.

Suitable diluents, preservatives, solubilizers, emulsifiers, adjuvant and/or excipients are also suitable carriers. Such carriers are liquids or lyophilized or otherwise dried formulations and include diluents of various buffer content (e.g., Tris-HCl, acetate, phosphate), pH1 and ionic strength additives such as albumin or gelatin to prevent absorption to surfaces, detergents (e.g., Tween 20, Tween 80, Phosphon F68, bile acid salts), solubilizing agents (e.g., glycerol, polyethylene glycol), anti-oxidants (e.g., ascorbic acid, sodium metabisulfite), preservatives (e.g., Thimerosal, benzyl alcohol, parabens), bulking substances or toxicity modifiers (e.g., lactose, mannitol), complexation with metal ions, or incorporation of the material into or onto particulate preparations of polymeric compounds such as polyactic acid, polyglycolic acid, hydrogels, etc. or onto liposomes, microemulsions, micelles, unilamellar or multilamellar vesicles, erythrocyte ghosts, or spheroplasts. Such carriers may influence the physical state, solubility, stability, rate of in vivo release, and/or rate of in vivo clearance.

Still referring to the above-mentioned protocol, the compound may be exposed to visible and/or near infrared light. This exposure of the compound to light may occur at any appropriate time but preferably occurs while the compound is located in the body (e.g., within the bloodstream and/or urinary system). Due to this exposure of the compound to the visible and/or near infrared light, the compound luminesces, emitting spectral energy (e.g., visible and/or near infrared light) that may be detected by appropriate detection equipment. The luminescence from the compound tends to exhibit a wavelength range greater than a wavelength range absorbed by the compound during excitation. For example, if an embodiment of the compound absorbs light of about 700 nm, the compound may luminesce, emitting light of about 745 nm.

Detection of the compound (or more particularly, the luminescence therefrom) may be achieved through optical fluorescence, absorbance or light scattering procedures known in the art. In one embodiment, this detection of the luminesced spectral energy may be characterized as a collection of the luminesced spectral energy and a generation of electrical signal indicative of the collected spectral energy. The mechanism(s) utilized to detect the luminescence from the compound that is present in the body may be designed to detect only selected wavelengths (or wavelength ranges) and/or may include one or more appropriate spectral filters. Various catheters, endoscopes, ear clips, hand bands, head bands, surface coils, finger probes and the like may be utilized to expose the compound to light and/or to detect the light luminesced therefrom [30]. This detection of luminescence may be accomplished at one or more times intermittently or may be substantially continuous.

Compounds of this invention may be provided in the form of a kit comprising a compound packaged in a container. In some embodiments, the compound may be dissolved a pharmaceutically acceptable carrier and provided in a single container. The pharmaceutically acceptable carrier may comprise any suitable vehicle, diluent, preservative, solubilizer, emulsifier, adjuvant, excipient and/or the like such as is known in the art and/or as is described above. In some embodiments, the compound may be in one container (e.g., in a dried or lyophilized form), and the pharmaceutically acceptable carrier may be in a separate container, all of which are packaged together in the kit. Kits of the invention may also include a package insert providing instructions for use.

Renal function of a patient may be determined based on the detected luminescence. This may be achieved by using data indicative of the detected luminescence and generating an intensity/time profile indicative of a clearance of the compound from the body. This profile may be correlated to a physiological or pathological condition. For example, the patient’s clearance profiles and/or clearance rates may be compared to known clearance profiles and/or rates to assess the patient’s renal function and to diagnose the patient’s physiological condition. In the case of analyzing the presence of the compound in bodily fluids, concentration/time curves may be generated and analyzed (preferably in real time) using an appropriate microprocessor to diagnose renal function.

Physiological function may be assessed by: (1) comparing differences in manners in which normal and impaired cells and/or tissues remove a compound of the invention from the bloodstream; (2) measuring a rate or an accumulation of a compound of the invention in organs or tissues; and/or (3) obtaining tomographic images of organs or tissues having a compound of the invention associated therewith.

The invention is further detailed in the following Examples, which are offered by way of illustration and are not intended to limit the scope of the invention in any manner.

General Experimental Conditions: Unless otherwise noted, all reagents were used as supplied. Analytical TLC was performed on Analtech silica gel GF plates (250 mm). Flash chromatography was carried out using either EMD Chemicals Inc. silica gel 60 (40–63 mm) or RediSep pre-packed silica gel columns on Combiflash chromatography system. RP-HPLC/MS (ESI, positive ion mode) analyses were carried out on a Waters Micromass ZQ system equipped with a PDA detector using Thermofisher Hypersil Gold C18 3 μm (4.6 mm×50 mm) gradient: 5-95% B/min; flow rate: 1 mL/min; mobile phase A: 0.05% TFA in H2O; mobile phase B: 0.05% TFA in CH3CN). Preparative RP-HPLC was carried out using a Waters Dual Pump system equipped with a Liquid Handler and a PDA detector [column: Waters XBridge™ Prep C18 OBD™ 5 μm 30×150 mm or Sunfire™ Prep C18 5 μm OBD™ 30×150 mm; λ max: PDA (200–600 nm); flow rate: 50 mL/min; gradient: 5-20 to 40-95% B/10-15 min; mobile phase A: 0.1% TFA in H2O; mobile phase B: 0.1% TFA in CH3CN]. RP-HPLC analyses were carried out on Agilent 1200 series system equipped with a UV detector (column: Phenomenex Luna 5 μm C18(2) 100 A 250×4.6 mm; flow rate: 1 mL/min; mobile phase A: 0.1% TFA in H2O; mobile phase B: 0.1% TFA in CH3CN). NMR spectra were recorded on either a Varian Gemini-300 or a VNMRS-500 spectrometer. Chemical shifts are expressed in parts per million (δ) relative to TMS (δ = 0) as an internal standard and coupling constants (J) are reported in Hz. HRMS (ESI) data was
obtained on a Thermo Scientific LTQ-Orbitrap mass spectrometer equipped with an IonMax electrospray ionization source in FTMS (Fourier Transform) mode with resolution ≤30 K.

**EXAMPLE 1**

3,6-Bis(2,5,8,11,14,17,20,23,26,29,32,35-dodecaoxaoctatriacontan-38-ylamino)-N²,N⁵-di(2,5,8,11,14,17,20,23,26,29,32,35-dodecaoxaoctatriacontan-37-y1)pyrazine-2,5-dicarboxamide (1)

Step 1. Synthesis of 3,6-diamino-N²,N⁵-di(2,5,8,11,14,17,20,23,26,29,32,35-dodecaoxaoctatriacontan-37-yl)pyrazine-2,5-dicarboxamide (2).

Step 2. To an orange solution of the above bis-amide 2 (2.24 g, 1.75 mmol) in anhydrous 1,2-dichloroethane (DCE, 65 mL), a solution of m-PEG™₁₂ propionaldehyde (3.00 g, 5.24 mmol) in DCE (5 mL) was added, and the reaction flask was immersed in an ice bath. Then glacial HOAc (0.30 mL, 5.20 mmol) was added followed by the addition of sodium triacetoxyborohydride (1.11 g, 5.24 mmol) in small portions over a 30 min period. The resulting reddish suspension was slowly allowed to warm to room temperature and stirred overnight (ca. 16 h) in an atmosphere of argon. The reaction
was quenched by a slow addition of saturated NaHCO₃ (50 mL) at 0°C. The biphasic mixture was stirred for 30 min, layers were separated, and the aqueous phase was further extracted with CHCl₃ (2×50 mL). The combined organic extracts were washed with 50% aqueous NaCl (50 mL) and brine (50 mL) and then dried over Na₂SO₄. Removal of solvents gave 6.89 g of red solid, which was subjected to purification by preparative RP-HPLC (XBridge, 20-45% B/15 min). The pure fractions were concentrated in vacuo, the residue was co-evaporated with CH₂CN (3×50 mL), and then dried under high vacuum to a constant weight to afford 1 (2.57 g, 61%) as red semi-solid (solidified upon storage in the refrigerator). H NMR (DMSO-d₆) 8.41 (t, 2, J=5.9), 7.30 (broad, 2), 3.65-3.34 [m, 192, includes broad peak at δ 3.49 for -(CH₂CH₂O)₈-], 3.23 (s, 12), 1.79-1.74 (quintet, 4); RP-HPLC (280 nm) 98% (tₚ=14.73 min); RP-LC/MS (ESI) m/z 1198.0 (M+2H)⁺, 1207.2 (M+H+NH₄)⁺, 1209.2 (M+H+Na)⁺ (tₚ=4.64 min). HRMS (ESI) m/z calculated for C₁₀₉H₁₅₂N₆O₇₇Na₃ (M+3Na)⁺ 820.7969; found 820.7969; calculated for C₁₀₈H₁₂₂N₆O₇₇Na₂ (M+2Na)⁺ 1219.7008; found 1219.7004; calculated for C₁₀₈H₁₁₂N₆O₇₇Na (M+Na)⁺ 2416.4123; found 2416.4162.

The general synthetic scheme is shown in FIG. 2, where the “X” variables represent various repeating units as further described and shown herein.

**EXAMPLE 2**

3,6-Bis(2,6,8,11,14,17,20,23,26,29,32,35-dodecaox-aocatracontan-38-ylamino)-N²,N⁶-di(2,5,8,11,14,17,20,23,26,29,32,35,38,41,44,47,50,53,56,59,62,65,68,71-tetraoxaocatriacontan-73-yl)pyrazine-2,5-dicarboxamide (3)

---

To a mixture of 3,6-diaminoypyrazine-2,5-dicarboxylic acid (0.316 g, 1.60 mmol), m-dPEG™₂₄ amine (4.00 g, 3.68 mmol), and PyBOP (1.92 g, 3.69 mmol) in anhydrous DMF (120 mL), was added Et₃N (8.00 mL, 57.4 mmol) and the reaction mixture was stirred overnight (ca. 20 h) at room temperature under argon. Most of the DMF was removed under high vacuum, the oil dissolved in CHCl₃ (250 mL) and washed successively with 0.50 M KH₂SO₄-brine (1:1, v/v), saturated NaHCO₃-brine (1:1, v/v), and brine (75 mL portions). The organic phase was dried over Na₂SO₄ concentrated in vacuo, and the was filtered through a bed of C₁₈ silica gel using CH₃CN—H₂O (3:1, v/v) as eluent to give the crude bis-amide 4 (5.32 g, 142%) as a brownish yellow solid, which was used as such in the next reaction without any further purification: RP-LC/MS (ESI) m/z 780.7 (M+3H)⁺, 1179.1 (M+H+NH₄)⁺, 1182.0 (M+H+Na)²⁺ (t₁₈=3.88 min).

Step 2. To a brownish yellow solution of the above bis-amine 4 (3.86 g crude, 1.16 mmol) in anhydrous DCE (45 mL), a solution of m-dPEG™₂₄ propionaldehyde (2.00 g, 3.49 mmol) in DCE (5 mL) was added, and the reaction flask was immersed in an ice bath. Then glacial HOAc (0.20 mL, 3.47 mmol) was added followed by the addition of sodium triacetoxystorylborohydride (0.740 g, 3.49 mmol) in small portions over a period of 1 h. The resulting redish suspension was slowly allowed to warm to room temperature and stirred overnight (ca. 22 h) in an atmosphere of argon. The reaction was quenched by a slow addition of saturated NaHCO₃ (50 mL) at 0°C. The biphasic mixture was stirred for 30 min, layers were separated, and the aqueous phase was further extracted with CHCl₃ (2×50 mL). The combined organic extracts were washed with brine (50 mL) and then dried over Na₂SO₄. Removal of solvents gave 5.93 g of red viscous oil, which was dialyzed against water using SpectroPor 7 dialysis tubing (MWCO 2,000 Da) to give 2.47 g of semi-pure product that was subjected to further purification by preparative RP-HPLC (EZBridge, 20-40% B/14 min). The pure fractions were concentrated in vacuo, then the residue was co-evaporated with anhydrous EtOAc (2×25 mL), and then dried under high vacuum to a constant weight to give 3 (1.84 g, 46%) as red semi-solid (solidified upon storage in the refrigerator): ¹H NMR (DMSO-d₆) 8.41 (t, 2, J=5.7), 7.87 (broad t, 2), 3.74-3.39 (m, 200), includes broad singlet at δ 3.49 for —(CH₂CH₂O)ₙ—, 3.34 (s, 88), 3.23, 3.22 (2 s, 12), 1.86-1.72 (quintet, 4); RP-HPLC (280 nm) 97% (t₁₈=14.69 min); RP-LC/MS (ESI) m/z 1166.73 (M+H+2Na)²⁺, 1737.73 (M+H+Na)²⁺, 1209.2 (M+H+Na)³⁺ (t₁₈=9.13 min, Phenomenex). HRMS (ESI) m/z calculated for C₁₅₅₆H₂₃₈N₄O₈₆Na₂ (M+3Na)⁺: 1173.0066. Found: 1173.0101; calculated for C₁₅₅₆H₂₃₈N₄O₈₆Na₂(Na²⁺)³⁺: 1748.0153. Found: 1748.0199; calculated for C₁₅₅₆H₂₃₈N₄O₈₆Na₂(M+Na)⁺: 3473.0415. Found: 3473.0421.

The general synthetic scheme is shown in FIG. 2, where the "X" variables represent various repeating units as further described and shown herein.

EXAMPLE 3

3,6-bis(2,5,8,11,14,17,20,23,26,29,32,35,38,41,44,47,50,53,56,59,62,65,68,71-tetraoxaspiroheptacentan-7-yl)pyrazine-2,5-dicarboxamide 4 (5.55 g crude, 136% yield material of 1.16 mmol) with m-dPEG™₂₄ propionaldehyde (2.60 g, 2.36 mmol) in the presence of HOAc (0.20 mL, 2.38 mmol) and sodium triacetoxystorylborohydride (0.508 g, 2.40 mmol) in DCE (40 mL) was carried out overnight as described in the preparation of Example 2 (incomplete by RP-LC/MS analysis). At this stage, the reaction mixture was treated with more m-dPEG™₂₄ propionaldehyde (0.400 g, 0.363 mmol), HOAc (0.021 mL, 0.363 mmol), and sodium triacetoxystorylborohydride (0.077 g, 0.363 mmol) as described above, and the reaction was continued overnight (still incomplete). After the usual work up described in Example 2, the crude product (5.70 g) obtained was subjected to purification by preparative RP-HPLC (EZBridge, 20-40% B/13 min) to afford 5 (0.869 g, 24%) as a brick-red solid: ¹H NMR (DMSO-d₆) 8.42 (t, 2, J=5.8), 7.95 (broad 2), 3.63-3.42 (m, 384, broad s at δ 3.51 for —(CH₂CH₂O)ₙ—, 3.24 (s, 12), 1.80-1.75 (quintet, 4); RP-HPLC (280 nm) 96% (t₁₈=13.16 min). HRMS (ESI) m/z calculated for C₁₅₅₆H₂₃₈N₄O₈₆Na₂ (M+4Na)⁴⁺: 1149.6596. Found: 1149.6617.
The general synthetic scheme is shown in FIG. 2, where the “X” variables represent various repeating units as further described and shown herein.

**EXAMPLE 4**

3,6-bis(2,5,8,11,14,17,20,23,26,29,32,35,38,41,44,47,50,53,56,59,62,65,68,71-tetraaxatetracontan-73-yl)pyrazine-2,5-dicarboxamide (6)

The reaction of 3,6-Diamino-N,N-di(2,5,8,11,14,17,20,23,26,29,32,35,38,41,44,47,50,53,56,59,62,65,68,71-tetraaxatetracontan-73-yl)pyrazine-2,5-dicarboxamide 4 (1.45 g crude, 142% yield material, 0.437 mmol) with m-dPEG<sup>3</sup>, propionaldehyde (0.520 g, 1.31 mmol) in the presence of H<sub>2</sub>OAc (0.070 mL, 1.21 mmol) and sodium triacetoxycarbonylborohydride (0.280 g, 1.32 mmol) in DCE (25 mL) was carried out overnight (ca. 18 h) as described in the preparation of Example 2 (incomplete by RP-LC/MS analysis). At this stage, the reaction mixture was treated with more m-dPEG<sup>3</sup>, propionaldehyde (0.230 g, 0.580 mmol), H<sub>2</sub>OAc (0.070 mL, 1.21 mmol), and sodium triacetoxycarbonylborohydride (0.120 g, 0.566 mmol) as described above, and the reaction was continued overnight (completed reaction). After the usual work up described in Example 2, the crude product (2.05 g) was subjected to purification by preparative RP-HPLC (XBridge, 20-40% B/15 min) to give brick-red 6 (0.625 g, 46%); <sup>1</sup>H NMR (DMSO-d<sub>6</sub>) 8.42 (t, J=6.0 Hz), 7.90 (broad, 2), 3.67-3.40 (m, 256, includes broad peak at 8.50 for —(CH<sub>2</sub>CH<sub>2</sub>OH)<sub>2</sub>—), 3.24, 3.23 (2 s, 12), 1.80-1.75 (quintet, 4); RP-HPLC (280 nm) 99% (t<sub>R</sub>=14.72 min); RP-LC/MS (ESI) m/z 1033.7 ([M+H]<sup>+</sup>); 1559.3 ([M+H+N<sub>2</sub>H<sub>4</sub>]<sup>2+</sup>) (t<sub>R</sub>=4.08 min). HRMS (ESI) m/z calculated for C<sub>140</sub>H<sub>276</sub>N<sub>2</sub>O<sub>56</sub>Na<sub>2</sub> (M+2Na)<sup>2+</sup> 1571.9105; found 1571.9145.

**EXAMPLE 5**

3,6-Bis(2,5,8,11-tetraoxatetradecan-14-ylamino)-N,N-di(2,5,8,11,14,17,20,23,26,29,32,35,38,41,44,47,50,53,56,59,62,65,68,71-tetraaxatetracontan-73-yl)pyrazine-2,5-dicarboxamide (7)
The reaction of 3,6-Diamo-N²,N²-di(2,5,8,11,14,17,20,23,26,29,32,35,38,41,44,47,50,53,56,59,62,65,68,71-tetra-cosaoxatridecan-73-yl)pyrazine-2,5-dicarboxamid 4 (1.80 g purified, 0.77 mmol) with m-DPEG™1 propionaldehyde (0.500 g, 2.27 mmol) in the presence of HOAc (1.00 mL, 17.3 mmol) and sodium triacetoxoborohydride (0.481 g, 2.27 mmol) in DCE (100 mL) was carried out overnight as described in the preparation of Example 2 (incomplete by RP-LC/MS analysis). At this stage, the reaction mixture was treated with a fresh batch of similar quantities of the reagents as described above and continued overnight (still incomplete). After the usual work up described in Example 2, the crude product was subjected to preparative RP-HPLC to afford 7 (0.620 g, 29%): ¹H NMR (CDCl₃) characteristic broad s at δ 3.65 and singlets at δ 3.39 and 3.38 for poly (ethylene glycol) moieties; RP-HPLC (280 nm) 94% (tₑ=15.36 min); RP-LC/MS (ESI) m/z 2747.2 (M+H)⁺ (tₑ=4.83 min).

The general synthetic scheme is shown in FIG. 2, where the “x” variables represent various repeating units as further described and shown herein.

EXAMPLE 6

3,6-Bis(2,6,8,11,14,17,20,23-octaaxadecosan-26-ylamino)-N²,N²-bis(R)-1-carboxy-2-hydroxyethyl] pyrazine-2,6-dicarboxamide (8)

Step 1. Synthesis of 3,6-diamo-N²,N²-bis(R)-1-(benzoxyl)-3-hydroxy-1-oxopropan-2-yl]pyrazine-2,5-dicarboxamide (9).

A 1-L round-bottom flask equipped with a Claisen adapter and an addition funnel was charged with D-serine benzyl ester hydrochloride (24.33 g, 105 mmol) and anhydrous DMF was cannulated into it. The resulting colorless solution was cooled in an ice-bath and stirred for 15 min in an atmosphere of N₂. Then DIPEA (19.16 mL, 110 mmol) was added dropwise via addition funnel over a 30 min period, and after 15 min, the cooling bath was removed and, 6-diaminopyrazine-2,5-dicarboxylic acid (9.91 g, 50.0 mmol) was added in one portion. The brick-red suspension was allowed to stir for 15 min before the addition of HOBt.H₂O (17.61 g, 115 mmol) in one portion. After another 15 min, the reaction flask was once again cooled in an ice-bath, and EDC.HCl (22.05 g, 115 mmol) was added in portions over a 10 min period. The resulting somewhat lighter and brown suspension was slowly allowed to warm to room temperature and stirred overnight (ca. 14 h) under N₂. The dark solution was concentrated to a syrupy residue under high vacuum (bath temp 60 °C) that was partitioned between EtOAc and milli-Q H₂O (400 mL each). The layers were separated and the aq layer was further extracted with EtOAc (3x200 mL) and the combined EtOAc extracts were successively washed with 0.50 M KHSO₄ saturated NaHCO₃, H₂O, and brine (250 mL each). The dried (Na₂SO₄) extracts were filtered (Whatman) and evaporated in vacuo to leave an orange slush that was dried under high vacuum over the weekend to 23.7 g of an orange solid. The crude product was subjected to flash chromatography over silica gel (EMD 60) using CHCl₃ to CHCl₃-CH₃OH (97:3, v/v) as eluant in a gradient fashion (sample adsorbed on silica gel was loaded on the column; carried out in 4 runs) to give the bis-amide 9 (19.6 g, 71%) as an orange solid: ¹H NMR (DMSO-d₆) 8.56 (d, 2, J=8.0 Hz), 7.40-7.33 (m, 10), 6.76 (s, 4), 5.37 (t, 2, J=5.5), 5.20 (distorted AB pair, 4), 4.66-4.63 (dt, 2, J=8.0, 4.0 Hz), 3.97-3.93 (m, 2), 3.81-3.77 (m, 2); ¹³C NMR (DMSO-d₆) 170.57, 165.39, 146.90, 136.33, 128.88, 128.48, 128.11, 126.34, 66.70, 61.59, 54.92; RP-LC/MS (ESI) m/z 553.3 (M+H)⁺ (tₑ=4.44 min). HRMS (ESI) m/z calculated for C₂₉H₂₆N₂O₆ (M+H)⁺ 575.1861; found 575.1859.

A 50 mL round-bottom flask equipped with magnetic stir bar and argon inlet was charged with the above bis-amide 9 (0.350 g, 0.633 mmol), m-dPEG™₄ propionaldehyde (1.00 g, 2.52 mmol) HOAc (0.190 g, 3.14 mmol) in DCE (25 mL) and sodium triacetoxyborohydride (0.537 g, 2.53 mmol) was added and stirred at room temperature over the weekend. The reaction was stirred for 30 min with saturated NaHCO₃ (25 mL), diluted with 50 mL CHCl₃ (50 mL), and the organic phase was separated and washed with brine. The organics were dried and concentrated in vacuo to give 1.30 g of red liquid that was subjected to preparative HPLC. The pure fractions were concentrated in vacuo to 1/2 volume and poured into a mixture of saturated NaHCO₃ and brine to extract with CHCl₃ (2×150 mL). The combined organics were dried and concentrated and vacuum dried to afford bis-benzyl ester 10 (0.390 g, 47%) as red oil: HRMS (ESI) m/z calculated for C₂₂H₁₉₃N₄O₂⁺ (M+H)+ 313.6862. Found 313.6907.

Step 3. A 250 mL round-bottom flask equipped with magnetic stir bar was charged with the above bis-benzyl ester 10 (0.390 g, 0.297 mmol) and ammonium formate (0.112 g, 1.78 mmol) in MeOH (10 mL) and water (10 mL). To this was added slurry of 10% Pd/C (0.095 g) in water (10 mL) and reaction mixture was stirred at 60°C. RP-LC/MS analysis after 1 h showed ~60% mono-ester and the rest starting material. At this stage, additional ammonium formate (0.112 g, 1.78 mmol) and 10% Pd/C (0.095 g) were added and the reaction was completed in an hour. The catalyst was removed by filtration through Celite, washed with deionized water (~100 mL), and the combined filtrates were concentrated in vacuo. The crude product was purified by preparative HPLC and the product was concentrated in vacuo and transferred into a 4 dram vial with acetonitrile, concentrated and vacuum dried to afford 8 (0.300 g, 76%) as red oil: HRMS (ESI) m/z calculated for C₄₄H₆₀N₆O₂⁺ (M+H)+ 1133.5923. Found 1133.5958.

The general synthetic scheme is shown in FIG. 3, where the “x” variables represent various repeating units as further described and shown herein.

EXAMPLE 7

3,6-Bis(2,5,8,11-tetraoxatetradecan-14-ylamino)-N², N²'-bis[(R)-1-carboxy-2-hydroxyethyl]pyrazine-2,5-dicarboxamide (11)
The general synthetic scheme is shown in FIG. 3, where the “x” variables represent various repeating units as further described and shown herein.

EXAMPLE 8

3,6-Bis(2,5,8,11-tetraoxatetradecan-14-ylamino)-N₂, N²-bis(2,3-dihydroxypropyl)pyrazine-2,5-dicarboxamide (13)

To a yellow suspension of 3,6-diamino-N²,N²-bis[(2,2-dimethyl-1,3-dioxolan-4-yl)methyl]pyrazine-2,5-dicarboxamide of (0.424 g, 1.00 mmol) in anhydrous DCE (25 mL), m-dPEG™₄ propionaldehyde (0.661 g, 3.00 mmol) was added, and the reaction flask was immersed in an ice bath. Then HClO₄ (0.17 mL, 2.95 mmol) was added followed by the addition of sodium triacetoxylorhydrine (0.628 g, 2.96 mmol) in small portions over a 40 min period. The resulting reddish suspension was slowly allowed to warm to room temperature and stirred overnight (ca. 20 h) in an atmosphere of argon (incomplete by RP-IC/MS analysis). The reaction mixture was treated with more m-dPEG™₄ propionaldehyde (0.165 g, 0.749 mmol), HClO₄ (0.040 mL, 0.694 mmol), and sodium triacetoxylorhydrine (0.160 g, 0.755 mmol) as described above, and after 8 h, quenched by slow addition of saturated NaHCO₃ (50 mL) at 0° C. The compound was extracted into CHCl₃ (150 mL), the organic layer was washed with water (50 mL) followed by brine (50 mL), and then dried over Na₂SO₄. Removal of solvents gave diacetide 14 (1.15 g) as a reddish gum that was used as such in the next reaction: RP-LC/MS (ESI) m/z 834.4 (M+H)^+ (τₑ=4.53 min).

Step 2. To a reddish solution of the above diacetide 14 (1.00 mmol) in THF (25 mL), was added 1.0 N HCl (5 mL) and stirred for 5 h in an atmosphere of argon. Most of the THF was removed from the reaction mixture, neutralized by 1.0 N NaOH, and concentrated in vacuo. The crude product (2.40 g) was subjected to preparative RP-HPLC (XBridge, 10-50% B/12 min) to afford diastereomeric 13 (0.554 g, 74%) as red gum: UV (λmax) 499 nm; ¹H NMR (CDCl₃) 8.66, 8.56 (2 t, 2), 6.24 (bd, s, 6), 4.40 (t, 1.5, J=4.2, 5.2), 4.23-4.15 (m, 1.5), 3.97-3.90 (m, 3), 3.70-3.50 (m, 36), 3.37, 3.36 (2 s, 6), 1.98-1.90 (quintet, 4); RP-HPLC (254 nm) 98% (rₑ=17.43 min, 5-50% B); RP-LC/MS (ESI) m/z 754.5 (M+H)^+ (τₑ=3.58 min). HRMS (ESI) m/z calculated for C₃₃H₆₁N₄O₁₄ [M+H]^+ 753.4240. found 753.4252.

The general synthetic scheme is shown in FIG. 4, where the “x” variables represent various repeating units as further described and shown herein.
The reaction of 3,6-diamino-N,N'-di(2,5,8,11,14,17,20,23,26,29,32,35-dodecaoxaheptatriacontan-37-yl)pyrazine-2,5-dicarboxamide (15) with m-dPEG™4 propionaldehyde (0.52 g, 2.36 mmol) in the presence of HOAc (0.13 mL, 2.27 mmol) and sodium triacetoxyborohydride (0.50 g, 2.36 mmol) in anhyd DCE (20 mL) was carried out overnight (ca. 18 h) as described in the preparation of Example 1 (incomplete by RP-LC/MS analysis). At this stage, the reaction mixture was treated with more m-dPEG™4 propionaldehyde (0.17 g, 0.77 mmol), HOAc (0.130 mL, 2.27 mmol), and sodium triacetoxyborohydride (0.17 g, 0.80 mmol) as described above, and the reaction was continued overnight (completed reaction). After the work up described in Example 1, the crude product (2.22 g) was subjected to purification by preparative RP-HPLC (XBridge, 30-40% B/25 min) to give compound 15 (0.391 g, 30%) as a red oil: 1H NMR (DMSO-d6) 8.42 (t, 2, J=6.0), 3.40-3.55 [m, 130, includes broad peaks at δ 3.50 for —(CH2CH2O)3—], 3.24, 3.22 (2 s, 12), 1.80-1.75 (quintet, 4); RP-HPLC (280 nm) 96% (tR=15.37 min); RP-LC/MS (ESI) m/z 846.2 (M+2H)²⁺, 1690.9 (M+H)⁺ (tR=4.07 min). HRMS (ESI) m/z calculated for C₇₀H₁₂₀N₄O₃₄ (M+H)⁺ 1690.0109, found 1690.0182; calculated for C₇₀H₁₂₀N₄O₃₄Na (M+Na)⁺ 1711.9989, found 1711.9929.

The general synthetic scheme is shown in FIG. 2, where the “X” variables represent various repeating units as further described and shown herein.

**EXAMPLE 10**

3,6-Bis(2,5,8,11,14,17,20,23-octaoxahexacosan-26-ylamino)-N,N'-di(2,6,8,11,14,17,20,23,26,29,32,35-dodecaoxaheptatriacontan-37-yl)pyrazine-2,5-dicarboxamide (16)
The reaction of 3,6-diamino-N²,N⁴-di(2,5,8,11,14,17,20,23,26,29,32,35-dodecaoxaheptatriacontan-57-yl)pyrazine-2,5-dicarboxamide 2 (1.00 g, 0.78 mmol) with m-dPEG™₈ propionaldehyde (0.93 g, 2.35 mmol) in the presence of HOAc (0.13 mL, 2.27 mmol) and sodium triacetoxyborohydride (0.50 g, 2.36 mmol) in anhyd DCE (20 mL) was carried out overnight (ca. 18 h) as described in the preparation of Example 1 (incomplete by RP-LC/MS analysis). At this stage, the reaction mixture was treated with m-dPEG™₈ propionaldehyde (0.31 g, 0.78 mmol), HOAc (0.13 mL, 2.27 mmol), and sodium triacetoxyborohydride (0.17 g, 0.80 mmol) as described above, and the reaction was continued overnight (completed reaction). After the work up described in Example 1, the crude product (2.41 g) was subjected to purification by preparative RP-HPLC (XBridge, 3.0-40% B in 20 min) to give compound 16 (0.237 g, 15%) as a red oil. H NMR (DMSO-d₆) δ 8.41 (t, J = 6.0), 3.40-3.55 (m, 162), includes broad peaks at 8.3.50 for -(CH₂CH₂O)₅-, 3.230, 3.227 (2 s, 12), 1.79-1.74 (quintet, 4); RP-HPLC (280 nm) 92% (tₑ=13.96 min); RP-LC/MS (ESI) m/z 1022.2 (M+2H)²⁺; (tₑ=4.09 min); HRMS (ESI) m/z calculated for C₉₂H₆₈N₂₀₄₂ (M+2H)²⁺: 1021.6140; found: 1021.5850; calculated for C₉₂H₆₈N₂₀₄₂ (M+H)⁺: 2042.2206; found: 2042.2082; calculated for C₉₀H₁₈₀N₆O₄₂Na (M+Na⁺): 2064.2026; found: 2064.30.

The general synthetic scheme is shown in FIG. 2, where the “x” variables represent various repeating units as further described and shown herein.

**EXAMPLE 11**

3,6-Bis(2,5,8,11-tetraoxatetradecan-14-ylamino) pyrazine-2,5-dicarboxamide (17)

**EXAMPLE 12**

Protocol for Assessing Renal Function

An example of an in vivo renal monitoring assembly 510 is shown in FIG. 5 and includes a light source 512 and a data processing system 514. The light source 512 generally includes or is interconnected with an appropriate device for exposing at least a portion of a patient's body to light therefrom. Examples of appropriate devices that may be interconnected with or be a part of the light source 512 include, but are not limited to, catheters, endoscopes, fiber optics, ear clips, hand bands, head bands, forehead sensors, surface coils, and finger probe. Indeed, any of a number of devices capable of emitting visible and/or near infrared light of the light source may be employed in the renal monitoring assembly 510.

Still referring to FIG. 5, the data processing system 514 of the renal monitoring assembly 510 may be any appropriate system capable of detecting spectral energy and processing data indicative of the spectral energy. For instance, the data processing system 514 may include one or more lenses (e.g., to direct and/or focus spectral energy), one or more filters (e.g., to filter out undesired wavelengths of spectral energy), a photodiode (e.g., to collect the spectral energy and convert...
the same into an electrical signal indicative of the detected spectral energy, an amplifier (e.g., to amplify electrical signal from the photodiode), and a processing unit (e.g., to process the electrical signal from the photodiode). This data processing system 514 is optionally configured to manipulate collected spectral data and generate an intensity/time profile and/or a concentration/time curve indicative of renal clearance of a compound of the present invention from the patient 520. Indeed, the data processing system 514 may be configured to generate appropriate renal function data by comparing differences in manners in which normal and impaired cells remove a compound of the invention from the bloodstream, to determine a rate or an accumulation of the compound in organs or tissues of the patient 520, and/or to provide tomographic images of organs or tissues having the compound associated therewith.

In one protocol for determining renal function, an effective amount of a compound of the invention is administered to the patient (e.g., in the form for a pharmaceutically acceptable composition). At least a portion of the body of the patient 520 is exposed to visible and/or near infrared light from the light source 512 as indicated by arrow 516. For instance, the light from the light source 512 may be delivered via a fiber optic that is affixed to an ear of the patient 520. The patient may be exposed to the light from the light source 512 before and/or after administration of the compound to the patient 520. In some cases, it may be beneficial to generate a background or baseline reading of light being emitted from the body of the patient 520 (due to exposure to the light from the light source 512) before administering the compound to the patient 520. When the compound that is in the body of the patient 520 is exposed to the light from the light source 512, the compound luminesces, emitting light (indicated by arrow 518) that is detected/collected by the data processing system 514. Initially, administration of the compound to the patient 520 generally enables an initial spectral signal indicative of the initial content of the compound in the patient 520. The spectral signal then tends to decay as a function of time as the compound is cleared from the patient 520. This decay in the spectral signal as a function of time is indicative of the patient’s renal function. For example, in a first patient exhibiting healthy/normal renal function, the spectral signal may decay back to a baseline in a time of T. However, a spectral signal indicative of a second patient exhibiting deficient renal function may decay back to a baseline in a time of T+4 hours. As such, the patient 520 may be exposed to the light from the light source 512 for any amount of time appropriate for providing the desired renal function data. Likewise, the data processing system 514 may be allowed to collect/detect spectral energy for any amount of time appropriate for providing the desired renal function data.

Referring now to FIG. 6, a further example of an in vivo monitoring assembly includes a source of electromagnetic radiation 610, an electromagnetic radiation detector 670 and a data processing system 680. The electromagnetic radiation source 610 generally includes or is interconnected with an appropriate device or devices 620 for exposing at least a portion of a subject’s body to electromagnetic radiation from 630. Examples of appropriate devices 620 that may be operationally connected to, or be a part of, the electromagnetic radiation source 610 include, but are not limited to, catheters, endoscopes, fiber optics, ear clips, hand bands, head bands, forehead sensors, surface coils, and finger probes. Indeed, any of a number of devices capable of emitting visible and/or near infrared electromagnetic radiation may be employed in a monitoring assembly.

The electromagnetic radiation detector 670 of the monitoring assembly may be any appropriate system capable of collecting and detecting electromagnetic radiation emitted from a subject 690. The electromagnetic radiation detector 670 may be operatively connected to, for example, one or more optical collection elements 650. The optical collection elements 650 of the monitoring assembly may include, among other elements, lenses, mirrors, filters, and fiber optics. Electromagnetic radiation detectors 670 suitable for use with the monitoring assembly include, but are not limited to, CCD detectors, CMOS detectors, photodiode detectors, photodiode array detectors, and photomultiplier tube detectors.

The data processing system 680 of the monitoring assembly may be any appropriate system capable of processing data obtained from the electromagnetic radiation detector 670. For instance, the data processing system 680 may include an amplifier (e.g., to amplify an electrical signal from the detector), and a processing unit (e.g., to process the electrical signal from the detector). The data processing system 680 is preferably configured to manipulate collected electromagnetic radiation data and generate an intensity as a function of time profile and/or a concentration as a function of time curve indicative of clearance of detectable agent, such as a compound of the formula (FX1)-(FX25), from a subject 690. Indeed, the data processing system 680 may be configured to generate appropriate data by comparing amount or concentration of the composition in the bloodstream or bodily fluid, to determine a rate of excretion or an accumulation of the composition in cells, organs or tissues of the subject 690, and/or to provide tomographic images of cells, organs or tissues having the optically functional composition associated therewith.

In one protocol for monitoring, an effective amount of a composition, such as a compound of the formula (FX1), is administered to the subject. At least a portion of the body of the subject is exposed to electromagnetic radiation 630 from the electromagnetic radiation source 610. For instance, the electromagnetic radiation 630 from the electromagnetic radiation source 610 may be delivered via a fiber optic 620 that is affixed to an ear of the subject 690. The subject 690 may be exposed to the electromagnetic radiation 630 from the electromagnetic radiation source 610 before, after or during administration of the composition to the subject 690. In some cases, it may be beneficial to generate a background or baseline reading of electromagnetic radiation 640 being emitted from the body of the subject 690, due to exposure to the electromagnetic radiation 630 from the electromagnetic radiation source 610, before administering the composition to the subject 690. When the optically functional composition that is in the body of the subject 690 is exposed to the electromagnetic radiation 630 from the electromagnetic radiation source 610, the optically functional compositions emit electromagnetic radiation 640 that is collected by the optical collection elements 650 and detected by the electromagnetic radiation detector 670. The signal from the electromagnetic radiation detector 670 is then analyzed by the data processing system 680.

EXAMPLE 13

Photophysical and Renal Clearance Properties of Exemplary Compounds

Spectral and pharmacokinetic properties, photophysical properties, urine percentages, tissue clearance (optical) and plasma pharmacokinetic clearances of some compounds
were measured according to the methods described below and herein. Table 1 shows the results of these measurements.

Photophysical Properties and Protein Binding.

In general, renally excretable compounds are dissolved in PBS buffer to form a 2 mM stock solution. The UV absorbance properties are determined on a 100 µm solution in PBS using a UV-3101PC UV-Vis-NIR scanning spectrophotometer system from Shimadzu. The fluorescence properties (λex, λem, and CPS at λem) are determined on a 10 µM solution in PBS using a Fluorolog-3 spectrophotometer system from Jobin Yvon Horiba. The percent plasma protein binding is determined on a 20 µM compound solution in rat plasma incubated at 37°C for 1 h. The separation of free from bound is made using an Amicon Centrifree YM-30 device (Regenerated Cellulose 30,000 MWCO) and a Z400K Refrigerated Universal Centrifuge from Hettich. The concentration of protein-free is determined via HPLC analysis using a set of external calibration standards and fluorescence detection.

Urine Elimination Studies.

Rat urine elimination studies are conducted in either conscious or anesthetized Sprague-Dawley rats. The test compound (1 mL, 2 mM in PBS) is administered by tail vein injection into conscious, restrained rats, with subsequent collection of urine at the time points of 2, 4, and 6 h post injection. The metabolic cages are washed with water to maximize the recovery of urine discharged at each time point. Alternatively, rats are anesthetized with 100 mg/kg Inactin intraperitoneally, a trachea tube is inserted to maintain adequate respiration, and 1 mL of test compound is injected into the lateral tail vein. Rats are placed on 37°C heat pad during the entire experiment. At 6 h post injection, the abdomen is opened, and the urine is removed from the bladder using a 21 gauge needle and a 3 cc syringe. Quantification of each compound in urine is performed via HPLC analysis using a set of external calibration standards and fluorescence detection. The percent recovery of compound in urine at each time point is calculated based on the balance of mass.

Non-Invasive Optical Pharmacokinetic Studies.

Male Sprague-Dawley rats (330-380 g) are anesthetized by Inactin (I.P.) or 2% Isoflurane gas anesthesia delivered by a small rodent gas anesthesia machine (RC2, VetEquip, Pleasanton, Calif.). The animals are placed on a heated board where temperature is maintained between 36-38°C. One ear from a test compound passing through the ear. After a 100 second baseline recording, 1 mL of a 2 mM solution is injected into the tail-vein of the rat and the fluorescence signal corresponding to plasma and tissue distribution and subsequent renal clearance of the compound is monitored at the ear. The pharmacokinetic parameters of the compounds are analyzed using WinNonlin pharmacokinetic modeling software (Pharsight, Mountain View, Calif.) and Microsoft (Redmond, Wash.) Excel. This method is used to detect renally excretable compounds of the invention and FIG. 8A provides a plot illustrating non-invasive in vivo fluorescence as a function of time following delivery of a renally excretable compound.

Optical Monitoring Apparatus and Protocol.

A schematic of the apparatus for non-invasive in vivo detection of fluorescence is shown in FIG. 7. A nominal 473 nm solid state laser source (100) is employed (Power Technology model LCDU12/7314). The laser source is directed into one leg (110) of a silica bifurcated fiber optic bundle (120) (Oriel #77565). The common end of this bifurcated bundle (130) is placed approximately 2 mm from the rat ear (140). The second leg of the bifurcated fiber optic bundle (150) is fitted with a collimating beam probe (160) (Oriel #77644). A long pass filter (170) (Semrock LP02-488RS-25) and narrow band interference filter (180) (Semrock FF01-595/40-25) are placed in front of a photomultiplier tube (190) (Hamamatsu photosensor module H7827-011). A chopper (200) (Stanford Research Systems model SR540) is placed after the laser and before the launch into the bifurcated cable. The output of the photosensor is connected to a lock-in amplifier (210) (Stanford Research Systems model SR830). The lock-in output is digitized (220) (National instruments NI-USB-6211) and the digitized data is acquired by computer using LabVIEW® data acquisition software (230).

Invasive Pharmacokinetic Studies.

Male Sprague-Dawley rats (330-380 g) are anesthetized by Inactin (I.P.). Rats are surgically instrumented with a trachea tube (PE-190) to facilitate breathing and femoral artery and vein catheters (PE-50 filled with 20 units/mL heparinized saline) for blood sampling and drug administration respectively. After administration of 1 mL of a 2 mM solution of
agent, approximately 200 µL blood is sampled and placed into a heparinized tube (Microtainer Brand Tubing w/ Lithium Heparin, BD 365971) at 0, 1, 6, 12, 18, 30, 45, 60, 90, 120 min. The concentration of compound in each centrifuged plasma sample is determined via HPLC analysis using a set of external calibration standards and fluorescence detection. The resulting pharmacokinetic parameters of the compound are analyzed using WinNonlin pharmacokinetic modeling software (Pharsight, Mountain View, Calif.). This method is used to detect readily excretable compounds of the invention and FIG. 8B provides a plot illustrating invasive PK (plasma concentration) as a function of time following delivery of a readily excretable compound.

**Probenecid Inhibition Studies.**

Six male Sprague-Dawley rats are treated in the same manner as described above in the invasive pharmacokinetic studies. 70 mg/kg Probenecid (Sigma-Aldrich, St. Louis, Mo.) 10 min prior to the test compound; this administration is flushed with 0.2 ml NaCl. An additional 6 rats are treated in the same fashion but do not receive probenecid.

**Non-Invasive and Invasive Concentration Correlation.**

Time course data from an invasive plasma pharmacokinetic (PK) experiment and a non-invasive optical monitoring experiment are used to correlate in vivo fluorescence with plasma concentration. By plotting the average relative fluorescence unit response from three optical monitoring runs versus concentration values from an invasive PK experiment for each time point, a good correlation can be demonstrated for a readily excretable compound. FIG. 8B provides a plot illustrating such a linear correlation. PK parameters are determined from the optical clearance data. Glomerular filtration rate (GFR) is estimated with reasonable accuracy from the pharmacokinetic clearance value derived from direct analysis of the non-invasive optical monitoring data.

**EXAMPLE 14**

**Visualization of Compounds During Surgery**

The compounds of any of formula (FX1)-(FX25) can be used in a surgical procedure to visualize bodily fluids, organs or tissues. The compounds of any of formula (FX1)-(FX25), for example, can be administered to a subject and allowed to collect in selected bodily fluids, organs, tissues or systems, such as urine and the renal system. The surgical area can then be illuminated with electromagnetic radiation, for example, electromagnetic radiation of wavelength selected over the range of 350 nanometers to 900 nanometers. The surgeon will then be able to see luminescence from the administered compound should the compound become exposed to the illuminating electromagnetic radiation. For example if a bodily fluid, such as urine, containing the administered compound is exposed to the illuminating electromagnetic radiation, the surgeon will see luminescence resulting therefrom.

Once administered to a subject, the compounds of any of formula (FX1)-(FX25) allow for more successful surgical outcomes, for example due to the ability of a surgeon to identify those bodily fluids and organs, such as of the renal system, which contain the administered compounds. Identification of these fluids and organs enables the surgeon to avoid unwanted damage to non-target organs and tissues during surgery. If, however, an organ or tissue comprising the administered compound is damaged, the luminescence from the administered compound in bodily fluids at or near the damage site will alert the surgeon to the damage. The surgeon can then take remedial measures and thereby reduce the extent of the damage to the subject.

**EXAMPLE 15**

**Modified Pyrazine Derivatives and Uses Thereof**

In an embodiment, the following compounds and methods are provided. It is noted the variable definitions are intended to be used only in this example.

![Formula I](image)

In a first aspect, the present invention is directed to compounds of Formula I and their pharmaceutically acceptable salts. With regard to Formula I, each of R¹ and R² is independently —H, —(CH₂)₃(CH₃CH₂O)₉R³, —(CH₂CH₂O)₉R³, —CH(COOH)CH₂OH, or C₆H₅CH₂OH polyhydroxylated alkyl. Further, each of R², R³ and R⁴ is independently —H or C₁-C₄ alkyl. Each occurrence of ‘m’, ‘n’ and ‘z’ independently varies from 2 to 6, inclusive. In addition, each occurrence of ‘p’ and ‘q’ independently varies from 1 to 9, inclusive, and each occurrence of ‘a’ independently varies from 1 to 100, inclusive.

With regard to Formula I, R¹ and R² are independently —H, —(CH₂)₃(CH₃CH₂O)₉R³, —(CH₂CH₂O)₉R³, —CH(COOH)CH₂OH, or C₆H₅CH₂OH polyhydroxylated alkyl. For instance, in some embodiments, each of R¹ and R² is —CH(COOH)CH₂OH. In other embodiments, each of R¹ and R² is —(CH₂CH₂O)₉R³. In still other embodiments, each of R¹ and R² is C₆H₅CH₂OH polyhydroxylated alkyl (e.g., each is C₃ polyhydroxylated alkyl, or each is C₃ polyhydroxylated alkyl). In even other embodiments, each of R¹ and R² is —H. In still other embodiments, each of R¹ and R³ is —(CH₂)₃(CH₃CH₂O)₉R³.

Still referring to compounds of Formula I, R², R⁴ and R³ are independently —H or C₁-C₄ alkyl. For example, in some embodiments, each occurrence of R³ may independently be C₁-C₄ alkyl (e.g., each occurrence of R³ is C₂ alkyl). In some embodiments, each of R² and R⁴ is —H. In other embodiments, each of R² and R⁴ is independently C₁-C₄ alkyl (e.g., each of R² and R⁴ is C₁ alkyl). ‘m’ independently varies from 2 to 6, inclusive. For instance, in some embodiments, ‘m’ may be 3 or 4 (e.g., ‘m’ may be 3 in some embodiments). Likewise, ‘n’ independently varies from 3 to 6, inclusive. For instance, in some embodiments, ‘n’ may be 3 or 4 (e.g., ‘n’ may be 3 in some embodiments). One of the benefits of and ‘n’ independently varying from 3 to 6 is that the pyrazine derivative can be “tuned” to a desired wavelength. In this regard, a pyrazine derivative having both ‘m’ and ‘n’ equal to 3 may absorb and/or luminesce at respective light wavelengths that are greater than (e.g., about 10-15 nm greater than) that of a generally similar pyrazine derivative where both ‘m’ and ‘n’ are equal to 2. A similar phenomenon could potentially be observed moving from 3 to 4, from 4 to 5, and/or from 5 to 6.
Accordingly, pyrazine derivatives of Formula I may be designed to absorb or/and luminesce at light wavelengths that may penetrate tissues better than that of lower light wavelengths.

Still referring to compounds of Formula I, each occurrence of 'p' and 'q' independently varies from 1 to 99, inclusive. For instance, in some embodiments, each of 'p' and 'q' independently varies from 2 to 40, inclusive. In other embodiments, each of 'p' and 'q' independently varies from 3 to 23, inclusive.

With regard to the various possibilities for R³ and R⁴ in Formula I, each occurrence of 'z' independently varies from 3 to 6, inclusive. For example, each occurrence of 'z' may be 3 or 4 in some embodiments. Further, each occurrence of 'a' independently varies from 1 to 100, inclusive. For instance, in some embodiments, each occurrence of 'a' independently vary from 10 to 40, inclusive. In other embodiments, each occurrence of 'a' independently varies from 12 to 24, inclusive.

A second aspect of the invention is directed to pharmaceutically acceptable compositions, each of which includes a compound (or pharmaceutically acceptable salt thereof) disclosed herein and a pharmaceutically acceptable carrier.

Still a third aspect of the invention is directed to methods of visualizing the urinary system and determining renal function using a compound (or pharmaceutically acceptable salt thereof) of Formula I. In these methods, an effective amount of the compound is administered into the body of a patient (e.g., a mammal such as a human or animal subject). The compound in the body of the patient is exposed to visible and/or near infrared light. Due to this exposure of the compound to light, the compound luminesces spectral energy that may be detected by appropriate detection equipment. For example, luminescence from the compound may be detected using an appropriate detection mechanism such as an invasive or non-invasive optical probe. The urinary system may be visualized and/or renal function may be determined based on the luminescence detected. For example, an initial amount of the compound present in the body of a patient may be determined by a magnitude/intensity of luminescence from the compound that is detected (e.g., in the bloodstream of the patient). As the compound is cleared from the body, the magnitude/intensity of detected luminescence tends to diminish. Accordingly, a rate at which this magnitude of detected luminescence diminishes may be correlated to a renal clearance rate of the patient. This detection may be done periodically or in substantially real time (providing a substantially continuous monitoring of renal function). Indeed, methods of the present invention enable renal function/clearance to be determined via detecting one or both a change and a rate of change of the detected magnitude of luminescence.

EXAMPLE 16

Optical Imaging Using Pyrazine Compounds

In general, molecules absorbing, emitting, or scattering in the visible or NIR region of the electromagnetic spectrum are useful for optical measurement. The high sensitivity associated with fluorescence permits detection without the negative effects of radioactivity or ionizing radiation. Pyrazine compounds of the invention absorb strongly in the red and NIR regions. Furthermore, the electronic properties of these systems are very sensitive to substitution patterns in the ring of the pyrazine compound and allows for “tuning” the absorption and emission properties using the information described herein.

In an embodiment of this aspect, the invention provides a method of using an optical agent, for example, in a biomedical procedure for optically imaging or visualizing a target tissue or a class of target tissues. The present methods include tissue selective imaging and visualization methods, such as imaging or visualization of renal tissue. A method of this aspect comprises the step of administering a diagnostically effective amount of a compound to a subject, wherein the compound is a compound having any of formulae (FX1) to (FX25) or a pharmaceutical preparation thereof. The present methods are useful for imaging or visualizing aspects of the renal system, for example.

In methods of this aspect, the compound that has been administered to the subject then is exposed in vivo to electromagnetic radiation and electromagnetic radiation emitted or scattered by the compound is then detected. In some embodiments, fluorescence is excited by the compound (e.g., due to the electromagnetic radiation exposure), in turn, via multiphoton excitation processes. In an embodiment particularly useful for imaging and/or visualization, the method of this aspect further comprises: (i) exposing a compound, such as a compound having any one of formulae (FX1) to (FX25), administered to the subject to electromagnetic radiation capable of exciting emission from the compound; and (ii) measuring the emission from the compound. In some embodiments, the methods of the present invention use fluorescence excitation via exposure to light having wavelengths selected over the range of 400-1300 nm. For example, optical coherence tomography (OCT) is an optical imaging technique compatible with the present compounds that allows high resolution cross sectional imaging of tissue microstructure. OCT methods use wavelengths of about 1280 nm. Use of electromagnetic radiation having wavelengths selected over the range of 700 nanometers to 1300 nanometers may be useful for some in situ optical imaging methods of the present invention, including biomedical applications for imaging organs, tissue and/or tumors, anatomical visualization, optical guided surgery and endoscopic procedures. Compounds in present methods may function as control agents, optical probes and/or tracer elements. The methods of the present invention include in vivo, in vitro and ex vivo imaging and visualization. The present invention provides methods for a range of clinical procedures, including optical imaging methods and/or visualization guided surgery and/or endoscopic diagnostic and therapeutic procedures.

The techniques utilized to detect the spectral energy from the pyrazine derivative that is present in the body may be designed to detect only selected wavelengths (or wavelength ranges) and/or may include one or more appropriate spectral filters. Various catheters, endoscopes, ear clips, headphones, surface coils, finger probes, and the like may be utilized to expose the pyrazine derivative to light and/or to detect light emitting therefrom. This detection of spectral energy may be accomplished at one or more times intermittently or may be substantially continuous.

Preferably, non-ionizing energy is administered to the subject or sample for detecting or imaging a compound of the invention. As used herein, the term “non-ionizing energy” generally refers to electromagnetic radiation that does not carry enough energy to completely remove at least one electron from an atom or molecule of the patient’s body. For example, in some embodiments, non-ionizing energy may include spectral energy ranging in wavelength from about 350 nm to about 1200 nm. In some embodiments, non-ionizing energy may simply include visible and/or near infrared light.
In one embodiment, the spectral properties of the compounds of the invention may be tuned to desired wavelength ranges for excitation and/or emission. This may be useful, for example, in developing a particular imaging technique using a known excitation source.

EXAMPLE 17

Methods of Monitoring Organ Function Using Pyrazine Compounds

The invention provides compositions and methods for monitoring organ function in a subject. In an embodiment, the present invention provides a method of using a detectable agent, the method comprising:

(i) administering a diagnostically effective amount of a detectable agent to a subject, for example, by administering the detectable agent into a bodily fluid of the subject, wherein the detectable agent is differentially separated from a bodily fluid by the organ or tissue; the detectable agent comprising a compound having formula (FX1), or a pharmaceutically acceptable salt or ester thereof:

![Chemical Structure](image)

wherein:

R<sup>1</sup> and R<sup>2</sup> are each independently —H, —(CH<sub>2</sub>)<sub>2</sub>(CH<sub>2</sub>OH)<sub>2</sub>, —(CH<sub>2</sub>OH)CH<sub>2</sub>OH or —(CH<sub>2</sub>)<sub>2</sub>Y<sup>1</sup>;

each Y<sup>1</sup> is independently —OR<sup>3</sup>, —(CH<OH)<br> HI, —N<sub>R</sub>—R<sup>3</sup>, —CONH<sub>R</sub><br> HI, —NHC(CH<sub>3</sub>)<sub>3</sub>(CH<sub>2</sub><br> OH)O)R<sup>2</sup>;

each of R<sup>2</sup>, R<sup>3</sup>, R<sup>4</sup> and R<sup>5</sup> are independently —H or C<sub>1</sub>—C<sub>3</sub> alkyli;

R<sup>4</sup> and R<sup>5</sup> are independently —H, C<sub>1</sub>—C<sub>3</sub> alkyli, —(CH<sub>2</sub>)<sub>2</sub> (CH<OH)<br> HI, R<sup>7</sup>, or —(CH<sub>2</sub>)<sub>3</sub>(CH<sub>2</sub>CH<sub>2</sub>O)<br> R<sup>2</sup>;

each a and c is independently an integer selected from the range of 0 to 6;

each b is independently an integer selected from the range of 1 to 120;

each p and q is independently an integer selected from the range of 0 to 120;

each of m and n is independently an integer selected from the range of 3 to 6;

(ii) exposing the detectable agent in a bodily fluid to electromagnetic radiation for exciting emission from the detectable agent;

(iii) measuring the emission from the detectable agent that is in a bodily fluid; and

(iv) determining the physiological function of the organ or tissue of the subject based on measurement of the emission. In an embodiment, for example, the organ or tissue is a kidney, or tissue or cells thereof, of the subject. In an embodiment, for example, the organ or tissue is a liver, or tissue or cells thereof, of the subject.

In an embodiment, a method of the invention of monitoring organ function comprises administering to a patient a compound having any one of formula selected from (FX1)-(FX25), including any of the specific compositions classes and compounds described in connection with formula (FX1)-(FX25). As will be understood by one of skill in the art, the present methods of monitoring organ function expressly include methods of using optical agents wherein the detectable agent includes the compound classes, compounds, and all variations thereof, described herein, including the compound classes, compounds and variations described in connection with any one of formulas (FX1)-(FX25).

In an embodiment, for example, the method further comprises exciting and measuring fluorescence from the detectable agent in the subject for a plurality of times after administration of the detectable agent. In an embodiment, a temporal profile of fluorescence from the detectable agent administered to the subject is determined and evaluated with respect to characterizing organ functioning, for example, by measuring a rate of change in fluorescence (e.g., a decrease in fluorescence) as a function of time, and optionally comparing the measured rate of change in fluorescence to a rate of change characteristic of a subject having a healthy organ or a subject having a known disease condition. Organ function can be assessed in the present methods by comparing differences in the manner in which normal and impaired cells remove the detectable agent (also referred to as a tracer in this context) from the bloodstream, by measuring the clearance or accumulation of these tracers in the organs or tissues, and/or by obtaining tomographic images of the organs or tissues. Blood pool clearance may be measured non-invasively from convenient surface capillaries such as those found in an ear lobe or a finger or can be measured invasively using an endovascular catheter. Accumulation of the tracer within the cells of interest can be assessed in a similar fashion. The clearance of the tracer compounds can be determined by selecting excitation wavelengths and filters for the emitted photons. The concentration vs time curves and/or fluorescence intensity vs time curves may be analyzed (preferably, but not necessarily in real time) by a microprocessor or the like.

Systems and methods of the present invention may optionally include an optical monitoring assembly or device for detecting optical agents of the invention. An example of an in vivo disease state optical monitoring assembly includes a source of electromagnetic radiation, an electromagnetic radiation detector and a data processing system. The electromagnetic radiation source generally includes or is interconnected with an appropriate device or devices for exposing at least a portion of a patient’s body to electromagnetic radiation therefrom. Examples of appropriate devices that may be operatively connected to, or be a part of, the electromagnetic radiation source include, but are not limited to, catheters, endoscopes, fiber optics, ear clips, hand bands, head bands, forehead sensors, surface coils, and finger probes. Indeed, any of a number of devices capable of emitting visible and/or near infrared electromagnetic radiation may be employed in an optical monitoring assembly.

The electromagnetic radiation detector of the optical monitoring assembly may be any appropriate system capable of collecting, detecting and measuring the intensity of electromagnetic radiation emitted from a subject. The electromagnetic radiation detector may be operatively connected to, for example, one or more optical collection elements. The optical collection elements of the optical monitoring assembly may include, among other elements, lenses, mirrors, optical filters (e.g., band pass filters and cut off filters), and fiber optics. Electromagnetic radiation detectors suitable for use with the
disease state optical monitoring assembly include, but are not limited to, CCD detectors, CMOS detectors, photodiode detectors, photodiode array detectors, and photomultiplier tube detectors.

The data processing system of the optical monitoring assembly may be any appropriate system capable of processing data obtained from the electromagnetic radiation detector. For instance, the data processing system may include an amplifier (e.g., to amplify an electrical signal from the detector), and a processing unit (e.g., to process the electrical signal from the detector). The data processing system is preferably configured to manipulate collected electromagnetic radiation data and generate an intensity as a function of time profile and/or a concentration as a function of time curve indicative of clearance of an optical agent, conjugate, bioconjugate or integrated bioconjugate composition of the present invention from a subject. Indeed, the data processing system may be configured to generate appropriate disease state or health state data by comparing differences in amount of normal and impaired cells in the bloodstream, to determine a rate or an accumulation of the composition in cells, organs or tissues of the subject, and/or to provide tomographic images of cells, organs or tissues having the optical agent, conjugate, bioconjugate or integrated bioconjugate composition associated therewith.

In one protocol for optical monitoring, an effective amount of a composition having formula (FX1)-(FX25) including an optical agent, conjugate, bioconjugate or integrated bioconjugate of the invention is administered to the subject. At least a portion of the body of the subject is exposed to visible and/or near infrared electromagnetic radiation from the electromagnetic radiation source. For instance, the electromagnetic radiation from the electromagnetic radiation source may be delivered via a fiber optic that is affixed to an ear of the subject. The subject may be exposed to electromagnetic radiation from the electromagnetic radiation source before, during or after administration of the composition to the subject. In some cases, it may be beneficial to generate a background or baseline reading of electromagnetic radiation being emitted from the body of the subject, due to exposure to the electromagnetic radiation from the electromagnetic radiation source, before administering the composition to the subject. When the optical agents, conjugates, bioconjugates or integrated bioconjugates of the composition that are in the body of the subject are exposed to the electromagnetic radiation from the electromagnetic radiation source, the optical agents, conjugates, bioconjugates or integrated bioconjugates emit electromagnetic radiation that is collected by optical collection elements and detected by the electromagnetic radiation detector. The signal from the electromagnetic radiation detector is then analyzed by the data processing system.

Initially, administration of the composition to the subject generally enables an electromagnetic radiation signal indicative of the content of the optical agent(s), conjugate(s), bioconjugate(s) or integrated bioconjugate(s) in the subject. In some embodiments, the electromagnetic radiation signal tends to decay as a function of time as the optical agent(s), conjugate(s), bioconjugate(s) or integrated bioconjugate(s) is cleared from the subject. In a subject with a healthy disease state, the electromagnetic radiation signal will decay to near the baseline level as the optical agent(s), conjugate(s), bioconjugate(s) or integrated bioconjugate(s) is cleared from the subject. In a subject with an unhealthy disease condition, the optical agent(s), conjugate(s), bioconjugate(s) or integrated bioconjugate(s) will not be cleared by the subject during the time scale of the monitoring, or will be cleared at a rate which differs from the healthy disease state clearance rate. As a result, the electromagnetic radiation signal may decay at a different rate. Alternatively, the electromagnetic radiation signal may not decrease to the baseline level, but will remain at an elevated level. The difference between this increased electromagnetic radiation signal level (or decay rate) and the baseline level (or decay rate) may be indicative of a disease state in the subject. Some methods of the present invention further comprise comparing the rate of decay of fluorescence intensity at a number of different times so as to assess the state of organ function. As such, the subject may be exposed to the electromagnetic radiation from the electromagnetic radiation source for any amount of time appropriate for providing the desired disease state monitoring data. Likewise, the electromagnetic radiation collection, detection, and data processing systems may be allowed to collect and detect electromagnetic radiation for any amount of time appropriate for providing the desired disease state monitoring data.

In addition to noninvasive techniques, a modified pulmonary artery catheter that can be used to make desired measurements has been developed. This is a distinct improvement over current pulmonary artery catheters that measure only intravascular pressures, cardiac output and other derived measures of blood flow. Current critically ill patients are managed using these parameters but rely on intermittent blood sampling and testing for assessment of renal function. These laboratory parameters represent discontinuous data and are frequently misleading in many patient populations. Yet, importantly, they are relied upon heavily for patient assessment, treatment decisions, and drug dosing.

The modified pulmonary artery catheter incorporates an optical sensor into the tip of a standard pulmonary artery catheter. This wavelength-specific optical sensor can monitor the renal function specific elimination of α designed optically detectable chemical entity. Thus, by a method substantially analogous to a dye dilution curve, real-time renal function can be monitored by the disappearance of the optically detected compound. Appropriate modification of a standard pulmonary artery catheter generally includes merely making the fiber optic sensor wavelength-specific. Catheters that incorporate fiber optic technology for measuring mixed venous oxygen saturation exist currently.

In an embodiment of this aspect, the present invention provides a method of monitoring a physiological state or condition of a patient undergoing treatment. In this method, an effective amount of an optical agent of the present invention is administered to a mammal (e.g., a patient undergoing treatment). Further, the optical agent that has been administered is exposed to electromagnetic radiation. In addition, electromagnetic radiation transmitted, scattered or emitted by the optical agent is detected. In some embodiments, a change in the wavelengths or intensities of electromagnetic radiation emitted by the optical agent that has been administered to the mammal may be detected and/or measured, optionally as a function of time. Methods of this aspect of the present invention include in situ, real time methods of monitoring renal function in the mammal, wherein the optical agent is cleared by the renal system of the subject.

In an embodiment particularly useful for monitoring physiological function of an organ or tissue of a subject, the method of this aspect further comprises: (i) exposing the detectable agent in the bodily fluid to electromagnetic radiation for exciting emission from the detectable agent; (ii) measuring the emission from the detectable agent that is in the bodily fluid; and (iii) determining the physiological function of the organ or tissue of the subject based on measurement of the emission. The present invention includes fluorescence detection of an agent which is cleared from the bloodstream by the
In an embodiment, the method comprises exposing the detectable agent in the bodily fluid to electromagnetic radiation having wavelengths selected over the range of 350 nm to 1300 nm. Optionally, excitation is achieved using electromagnetic radiation substantially free (e.g., less than about 10% of total radiant energy) of ultraviolet radiation for example to minimize exposure of the subject to electromagnetic radiation capable of causing unwanted cell or tissue damage. Excitation of optical agents may be provided by a wide range of techniques and optical sources as known in the art, including use of laser, fiber optic and/or endoscopic optical sources and methods. The present invention includes methods using multiphoton excitation of optical agents. In an embodiment, the method comprises measuring fluorescence from the detectable agent having wavelengths selected over the range of 350 nm to 1300 nm. Detection of emission, including fluorescence, can be achieved by wide a range of techniques and detection systems as known in the art, including detection by eye (e.g., visualization) and two-dimensional or three-dimensional detection.

EXAMPLE 18

Pharmaceutical Formulations

Therapeutically Effective Amount

Toxicity and diagnostic efficacy of compounds of the invention can be determined by standard pharmaceutical procedures in cell cultures or experimental animals for determining the LD50 (the dose lethal to 50% of the population) and the ED50 (the dose therapeutically effective in 50% of the population). The dose ratio between toxic and therapeutic effects is the therapeutic index that can be expressed as the ratio LD50/ED50. Compounds that exhibit large therapeutic indices are preferred. While compounds exhibiting toxic side effects may be used, care should be taken to design a delivery system that minimizes potential damage to cells and reduce side effects.

The data obtained from the cell culture assays and animal studies can be used in formulating a range of dosages for use in humans and other mammals. The dosage of such compounds lies preferably within a range of circulating plasma or other bodily fluid concentrations that include the ED50 and provides effective imaging results (i.e., ability to image or diagnose a condition or system). The dosage may vary within this range depending upon the dosage form employed and the route of administration utilized. For any compound of the present invention, the visually effective amount can be estimated initially from cell culture assays. A dosage may be formulated in animal models to achieve a circulating plasma concentration range that includes the IC50 (the concentration of the test compound that achieves a half-maximal inhibition of symptoms) as determined in cell culture. Such information can be used to more accurately determine useful dosages in humans and other mammals. Compound levels in plasma may be measured, for example, by high performance liquid chromatography.

As used herein, a “bodily fluid” is a liquid originating inside a living organism. A bodily fluid can be excretable or secretable from the body. Blood or blood components are particular examples of bodily fluids.

As used herein, “proximate” means near or on. For example, a sensor is located proximate to a light emission source if the sensor can detect the light emission. As used herein, “renal function” is a measure of the functioning of the renal system or component thereof. The renal system includes the kidneys, renal artery, and urinary system.
An amount of a compound that may be combined with a pharmaceutically acceptable carrier to produce a single dosage form will vary depending upon the host treated and the particular mode of administration. It will be appreciated by those skilled in the art that the unit content of a compound contained in an individual dose of each dosage form need not in itself constitute effective imaging amount, as the necessary imaging effective amount could be reached by administration of a number of individual doses. The selection of dosage depends upon the dosage form utilized, and the particular purpose to be achieved according to the determination of those skilled in the art.

The dosage and dosage regime for imaging a disease or condition may be selected in accordance with a variety of factors, including the type, age, weight, sex, diet and/or medical condition of the patient, the route of administration, pharmaceutical considerations such as activity, efficacy, pharmacokinetic and/or toxicology profiles of the particular compound employed, whether a compound delivery system is utilized, and/or whether the compound is administered as a pro-drug or part of a drug combination. Thus, the dosage regime actually employed may vary widely from subject to subject, or disease to disease and different routes of administration may be employed in different clinical settings.

Subjects are preferably animals (e.g., mammals, reptiles and/or avians), more preferably humans, horses, cows, dogs, cats, sheep, pigs, and/or chickens, and most preferably humans.

In an embodiment, the invention provides a medicament which comprises an imaging or diagnostically effective amount of one or more compositions of the invention, such as a compound of any one of formulas (FX1)-(FX25). In an embodiment, the invention provides a method for making a medicament for imaging or diagnosing of a condition described herein such as renal failure or renal system disorder. In an embodiment, the invention provides a method for making a medicament for diagnosis or aiding in the diagnosis of a condition described herein. In an embodiment, the invention provides the use of one or more compositions set forth herein for the making of a medicament.

Compounds of the invention can have prodrug forms. Prodrugs of the compounds of the invention are useful in embodiments including compositions and methods. Any compound that will be converted in vivo to provide a biologically, pharmaceutically, or diagnostically active form of a compound of the invention is a prodrug. Various examples and forms of prodrugs are well known in the art. Examples of prodrugs are found, inter alia, in Design of Prodrugs, edited by H. Bundgaard, (Elsevier, 1985); Methods in Enzymology, Vol. 42, at pp. 309-396, edited by K. Widder, et. al. (Aademic Press, 1985); A Textbook of Drug Design and Development, edited by Krosgaard-Larsen and H. Bundgaard, Chapter 5, “Design and Application of Prodrugs,” by H. Bundgaard, at pp. 113-191, 1991); H. Bundgaard, Advanced Drug Delivery Reviews, Vol. 8, p. 1-38 (1992); H. Bundgaard et al., Journal of Pharmaceutical Sciences, Vol. 77, p. 285 (1988); and Nogrady (1985) Medicinal Chemistry A Biochemical Approach, Oxford University Press, New York, pages 388-392). A prodrug, such as a pharmaceutically acceptable prodrug can represent prodrugs of the compounds of the invention which are, within the scope of sound medical judgment, suitable for use in contact with the tissues of humans and lower animals without undue toxicity, irritation, allergic response, and the like, commensurate with a reasonable benefit/risk ratio, and effective for their intended use. Prodrugs of the invention can be rapidly transformed in vivo to a parent compound of a compound described herein, for example, by hydrolysis in blood or by other cell, tissue, organ, or system processes. Further discussion is provided in I. Higuchi and V. Stella, Pro-drugs as Novel Delivery Systems, V. 14 of the A.C.S. Symposium Series, and in Edward B. Roche, ed., Bioerodable Carriers in Drug Design, American Pharmaceutical Association and Pergamon Press (1987).

The invention contemplates pharmaceutically active compounds either chemically synthesized or formed by in vivo biotransformation to compounds set forth herein.

In an embodiment, a composition of the invention is isolated or purified. In an embodiment, an isolated or purified compound may be at least partially isolated or purified as would be understood in the art. In an embodiment, the composition of the invention has a chemical purity of 95%, optionally for some applications 99%, optionally for some applications 99.99%, optionally for some applications 99.999% pure, and optionally for some applications 99.9999% pure.

Typically, a compound of the invention, or pharmaceutically acceptable salt thereof, is administered to a subject in a diagnostically or imaging effective amount. One skilled in the art generally can determine an appropriate dosage. Factors affecting a particular dosage regimen (including the amount of compound delivered, frequency of administration, and whether administration is continuous or intermittent) include, for example, the type, age, weight, sex, diet, and condition of the subject; the type of pathological condition and its severity; and the nature of the desired therapeutic effect. Pharmacological considerations include compound activity, efficacy, pharmacokinetic, and toxicology profiles of the particular compound used; the route of administration and whether a drug delivery system is utilized; and whether the compound is administered as part of a combination therapy (e.g., whether the agent is administered in combination with one or more other active compounds, other agents, radiation, and the like).

Compositions for oral administration may be, for example, prepared in a manner such that a single dose in one or more oral preparations contains at least about 20 mg of the pyrazine compound per square meter of subject body surface area, or at least about 50, 100, 150, 200, 300, 400, or 500 mg of the pyrazine compound per square meter of subject body surface area (the average body surface area for a human is, for example, 1.8 square meters). In particular, a single dose of a composition for oral administration can contain from about 20 to about 600 mg, and in certain aspects from about 20 to about 400 mg, in another aspect from about 20 to about 300 mg, and in yet another aspect from about 20 to about 200 mg of the pyrazine compound per square meter of subject body surface area. Compositions for parenteral administration can be prepared in a manner such that a single dose contains at least about 20 mg of the pyrazine compound per square meter of subject body surface area, or at least about 40, 50, 100, 150, 200, 300, 400, or 500 mg of the pyrazine compound per square meter of subject body surface area. In particular, a single dose in one or more parenteral preparations contains from about 20 to about 500 mg, and in certain aspects from about 20 to about 400 mg, and in another aspect from about 20 to about 450 mg, and in yet another aspect from about 20 to about 350 mg of the pyrazine compound per square meter of subject body surface area. It should be recognized that these oral and parenteral dosage ranges represent generally preferred dosage ranges, and are not intended to limit the invention. The dosage regimen actually employed can vary widely, and, therefore, can deviate from the generally preferred dosage regimen. It is contemplated that one skilled in the art will tailor these ranges to the individual subject.

It is further contemplated that the pyrazine compounds and salts of this invention can be used in the form of a kit that is
suitable for use in performing the methods described herein, packaged in a container. The kit can contain the pyrazine compounds and, optionally, appropriate diluents, devices or device components suitable for administration and instructions for use in accordance with the methods of the invention. The devices can include parenteral injection devices, such as syringes or transdermal patch or the like. Device components can include cartridges for use in injection devices and the like. In one aspect, the kit includes a first dosage form including a pyrazine compound or salt of this invention and a second dosage form including another active ingredient in quantities sufficient to carry out the methods of the invention. The first dosage form and the second dosage form together can include a diagnostically effective amount of the compounds for imaging or diagnosing the targeted condition(s).

This invention also is directed, in part, to pharmaceutical compositions including a diagnostically effective amount of a compound or salt of this invention, as well as processes for making such compositions. Such compositions generally include one or more pharmaceutically acceptable carriers (e.g., excipients, vehicles, auxiliaries, adjuvants, diluents) and may include other active ingredients. Formulation of these compositions may be achieved by various methods known in the art. A general discussion of these methods may be found in, for example, Hoover, John E., Remington's Pharmaceutical Sciences (Mack Publishing Co., Easton, Pa.: 1975). See also, Lachman, L., eds., Pharmaceutical Dosage Forms (Marcel Decker, New York, N.Y., 1980).

The preferred composition depends on the route of administration. Any route of administration may be used as long as the target of the compound or pharmaceutically acceptable salt is available via that route. Suitable routes of administration include, for example, oral, intravenous, parenteral, inhalation, rectal, nasal, topical (e.g., transdermal and intracutaneous), intravesical, intrathecal, enteral, pulmonary, intramyocardial, intracavitary, vaginal, intraskeletal, intradermal, subcutaneous, intraperitoneal, intravenous, intramuscular, sublingual, and intestinal administration.

Pharmaceutically acceptable carriers that may be used in conjunction with the compounds of the invention are well known to those of ordinary skill in the art. Carriers can be selected based on a number of factors including, for example, the particular pyrazine compounds or pharmaceutically acceptable salt(s) used; the compound's concentration, stability, and intended bioavailability; the condition being treated; the subject's age, size, and general condition; the route of administration; etc. A general discussion related to carriers may be found in, for example, J. G. Naim, Remington's Pharmaceutical Science, pp. 1492-1517 (A. Gennaro, ed., Mack Publishing Co., Easton, Pa. (1985)).

Solid dosage forms for oral administration include, for example, capsules, tablets, gelcaps, pills, dragees, troches, powders, granules, and lozenges. In such solid dosage forms, the compounds or pharmaceutically acceptable salts thereof can be combined with one or more pharmaceutically acceptable carriers. The compounds and pharmaceutically acceptable salts thereof can be mixed with carriers including, but not limited to, lactose, sucrose, starch powder, corn starch, potato starch, magnesium carbonate, microcrystalline cellulose, cellulose esters of aliphatic acids, cellulose alkyd esters, tate, stearic acid, magnesium stearate, magnesium oxide, sodium and calcium salts of phosphoric and sulfuric acids, sodium carbonate, agar, mannitol, sorbitol, sodium saccharin, gelatin, acacia gum, alginic acid, sodium alginate, tragacanth, colloidal silic acid, crossccarmellose sodium, polyvinylpyrrolidone, and/or polyvinyl alcohol, and then tableted or encapsulated for convenient administration. Such capsules or tablets may contain a controlled-release formulation, as can be provided in a dispersion of the compound or salt in hydroxypropylmethyl cellulose. In the case of capsules, tablets, and pills, the dosage forms also can include buffering agents, such as sodium citrate, or magnesium or calcium carbonate or bicarbonate. Tablets and pills additionally can, for example, include a coating (e.g., an enteric coating) to delay disintegration and absorption. The concentration of the pyrazine compound in a solid oral dosage form can be from about 5 to about 50%, and in certain aspects from about 8 to about 40%, and in another aspect from about 10 to about 30% by weight based on the total weight of the composition.

Liquid dosage forms of the compounds of the invention for oral administration include, for example, pharmaceutically acceptable emulsions, solutions, suspensions, syrups, and elixirs containing inert diluents commonly used in the art (e.g., water). Such compositions also can include adjuvants, such as wetting, emulsifying, suspending, flavoring (e.g., sweetening), and/or perfuming agents. The concentration of the pyrazine compound in the liquid dosage form can be from about 0.01 to about 5 mg, and in certain aspects from about 0.01 to about 1 mg, and in another aspect from about 0.01 to about 0.5 mg per ml of the composition. Low concentrations of the compounds of the invention in liquid dosage form can be prepared in the case that the pyrazine compound is more soluble at low concentrations. Techniques for making oral dosage forms useful in the invention are generally described in, for example, Modern Pharmaceutics, Chapters 9 and 10 (Banker & Rhodes, Editors (1979)). See also, Lieberman et al., Pharmaceutical Dosage Forms: Tablets (1981). See also, Ansel, Introduction to Pharmaceutical Dosage Forms (2nd Edition (1976)).

In some aspects of the invention, tablets or powders for oral administration can be prepared by dissolving the pyrazine compound in a pharmaceutically acceptable solvent capable of dissolving the compound to form a solution and then evaporating when the solution is dried under vacuum. A carrier can also be added to the solution before drying. The resulting solution can be dried under vacuum to form a glass. The glass can then mix with a binder to form a powder. This powder may be mixed with fillers or other conventional tableting agents, and then processed to form a tablet. Alternatively, the powder may be added to a liquid carrier to form a solution, emulsion, suspension, or the like.

In some aspects, solutions for oral administration are prepared by dissolving the pyrazine compound in a pharmaceutically acceptable solvent capable of dissolving the compound to form a solution. An appropriate volume of a carrier is added to the solution while stirring to form a pharmaceutically acceptable solution for oral administration.

"Parenteral administration" includes subcutaneous injections, intravenous injections, intraarterial injections, intraocular injections, intracapsular injections, intraperitoneal injections, intramuscular injections, intradermal injections, and infusion. Dosage forms suitable for parenteral administration include solutions, suspensions, dispersions, emulsions, and any other dosage form that can be administered parenterally.

Injectable preparations (e.g., sterile injectable aqueous or oleaginous suspensions) can be formulated according to the known art using suitable dispersing, wetting agents, and/or suspending agents. Acceptable vehicles for parenteral use include both aqueous and nonaqueous pharmaceutically-acceptable solvents. Suitable pharmaceutically acceptable
aqueous solvents include, for example, water, saline solutions, dextrose solutions (e.g., such as DWS), electrolyte solutions, etc.

In one embodiment, the present pyrazine compounds are formulated as nanoparticles or microparticles. Use of such nanoparticle or microparticle formulations may be beneficial for some applications to enhance delivery, localization, target specificity, administration, etc. of the pyrazine compound. Potentially useful nanoparticles and microparticles include, but are not limited to, micelles, liposomes, microemulsions, nanoemulsions, vesicles, tubular micelles, cylindrical micelles, bilayers, folded sheets structures, globular aggregates, swollen micelles, inclusion complex, encapsulated droplets, microcapsules, nanocapsules or the like. As will be understood by those having skill in the art, the present pyrazine compounds can be located inside the nanoparticle or microparticle, within a membrane or wall of the nanoparticle or microparticle, or outside of (but bonded to or otherwise associated with) the nanoparticle or microparticle. The agent formulated in nanoparticles or microparticles may be administered by any of the routes previously described. In a formulation applied topically, the pyrazine compound is slowly released over time. In an injectable formulation, the liposome, micelle, capsule, etc., circulates in the bloodstream and is delivered to the desired site (e.g., renal system).

Preparation and loading of nanoparticles and microparticles are well known in the art. As one example, liposomes may be prepared from dipalmitoyl phosphatidylcholine (DPPC) or egg phosphatidylcholine (PC) because this lipid has a low transition temperature. Liposomes are made using standard procedures as known to one skilled in the art (e.g., Braun-Falco et al., (Eds.), Griesbach Conference, Liposome Dermatics, Springer-Verlag, Berlin (1992), pp. 69-81; 91 117 which is expressly incorporated by reference herein). Poly-caprolactone, poly(glycolic acid), poly(lactic acid), polyanhydride or lipids may be formulated as microspheres. As an illustrative example, the present pyrazine compounds may be mixed with polyvinyl alcohol (PVA), the mixture then dried and coated with ethylene vinyl acetate, then cooled again with PVA. In a liposome, the present pyrazine compounds may be within one or both lipid bilayers, in the aqueous between the bilayers, or within the center or core. Liposomes may be modified with other molecules and lipids to form a cationic liposome. Liposomes may also be modified with lipids to render their surface more hydrophilic which increases their circulation time in the bloodstream. The thus-modified liposome has been termed a “stealth” liposome, or a long-lived liposome, as described in U.S. Pat. No. 6,258,378, and in Stealith Liposomes, Lasie and Martin (Eds.) 1995 CRC Press, London, which are expressly incorporated by reference herein. Encapsulation methods include detergent dialysis, freeze drying, film forming, injection, as known to one skilled in the art and disclosed in, for example, U.S. Pat. No. 6,406, 713 which is expressly incorporated by reference herein in its entirety. Optionally, the present compositions and methods include a micelle delivery system, for example, involving one or more PEG-based amphiphilic polymers developed for drug delivery including PEG-poly(ε-caprolactone), PEG-poly (amino acid), PEG-polyacrylate or a PEG-phospholipid constructs; a cross linked poly(acrylic acid) polymer system, a phospholipid-based system and/or block copolymer systems comprising one or more of the following polymer blocks a poly(lactic acid) polymer block, a poly(propylene glycol) polymer block; a poly(amino acid) polymer block; a poly(ester) polymer block; and a poly(ε-caprolactone) polymer block, a poly(ethylene glycol) block, a poly(acrylic acid) block, a polylactide block, a polyester block, a polyamide block, a polyanhydride block, a polyurethane block, a polyimine block, a polyurea block, a polycetal block, a polysaccharide block and a polysiloxane block.

Suitable pharmaceutically-acceptable nonaqueous solvents include, but are not limited to, the following (as well as mixtures thereof): alcohols (these include, for example, α-glycidol formal, β-glycerol formal, 1,3-butylene glycol, aliphatic or aromatic alcohols having from 2 to about 30 carbons (e.g., methanol, ethanol, propanol, isopropanol, butanol, t-butanol, hexanol, octanol, amylene hydrate, benzyl alcohol, glyceral (glycerol), glycol, hexylene, glycol, tetrahydrofuran, alcohol, cetyl alcohol, and stearyl alcohol), fatty acid esters of fatty alcohols (e.g., polyglycerol esters, such as polyglycerols glycol and polyethylene glycol), sorbitan, sucrose, and cholesterol); amides (these include, for example, dimethylacetamide (DMA), benzyl benzoate DMA, dimethylformamide, N-hydroxyethyl-N-lactlamide, N,N-dimethylacetamide-amides, 2-pyrolidinone, 1-methyl-2-pyrolidinone, and polyvinylpyrrolidone); esters (these include, for example, acetic esters (e.g., monacetic, diacetic, and triacetic)), aliphatic and aromatic esters (e.g., ethyl caprylate or octanoate, allyl oleate, benzyl benzoate, or benzyl acetate), dimethylsulfoxide (DMSO), esters of glycerin (e.g., mono, di, and triglycerol citrates and tartrates), ethyl benzoate, ethyl acetate, ethyl carbonate, ethyl lactate, ethyl oleate, fatty acid esters of sorbitan, glycerol monostearate, glyceride esters (e.g., mono, di, or tri-glycerides), fatty acid esters (e.g., isopropyl myristate), fatty acid derived PEG esters (e.g., PEG-9hydroxyoleate and PEG-9hydroxyoctaerate), N-methyl pyrrolidinone, pluronic 60, polyoxyethylene sorbitol oleic polyesters (e.g., poly(etheramylated)50-60 sorbitol poly oleate) [poly(oxyethylene)5,20 monostearate, poly(oxyethylene)15-20 mono 12-hydroxyoctaerate, and poly(oxyethylene)15-20 mono ricinoleate], polyoxyethylene sorbitan esters (e.g., polyoxyethylene-sorbitan monooleate, polyoxyethylene-sorbitan monopalmitate, polyoxyethylene-sorbitan monolaurate, polyoxyethylene-sorbitan monoestearate, and POLYSORBATE 20, 40, 60, and 80 (from ICI Americas, Wilmington, Del.),), polyvinylpyrrolidone, alkyleneoxy modified fatty acid esters (e.g., polyoxyl 40 hydrogenated castor oil and polyoxyethyleneated castor oils, such as CREMOPHOR EL solution or CREMOPHOR RH 40 solution), saccharide fatty acid esters (i.e., the condensation product of a monosaccharide (e.g., pentoses, such as, ribose, ribulose, arabinose, xylose, lyxose, and xylulose; hexoses, such as glucose, fructose, galactose, mannose, and sorbose; trioses; tetrose; heptose; and octose), disaccharide (e.g., sucrose, maltose, lactose, and trehalose), oligosaccharide, or a mixture thereof with one or more C3-C22 fatty acids (e.g., saturated fatty acids, such as caprylic acid, capric acid, lauric acid, myristic acid, palmitic acid, and stearic acid; and unsaturated fatty acids, such as palmitoleic acid, oleic acid, elaidic acid, erucic acid, and linoleic acid), and steroidal esters); others (these are typically alky laryl, and cyclic ethers having from 2 to about 30 carbons. Examples include diethyl ether, tetrahydrofuran, dimethyl isosorbide, diethylene glycol monoethyl ether), and glycofurol (tetrahydrofurfuryl alcohol polyethylene glycol ether); ketones (these typically have from about 3 to about 30 carbons. Examples include acetone, methyl ethyl ketone, methyl isobutyl ketone); hydrocarbons (these are typically aliphatic, cycloaliphatic, and aromatic hydrocarbons having from about 4 to about 30 carbons). Examples include benzene, cyclohexane, dichloromethane, dioxolanes, hexane, n-decane, n-dodecane, n-hexane, sulfolane, tetramethylene sulfone, tetramethylenesulfone, toluene, dimethyl sulfoxide (DMSO); and tetramethylene sulf oxide; oils (these include oils of mineral, vegetable, animal,
essential, or synthetic origin). These include mineral oils, such as aliphatic and wax-based hydrocarbons, aromatic hydrocarbons, mixed aliphatic and aromatic based hydrocarbons, and refined paraffin oil; vegetable oils, such as linseed, tung, safflower, soybean, castor, cottonseed, groundnut, rape-seed, coconut, palm, olive, corn, corn germ, sesame, persic; and peanut oil; glycerides, such as mono-, di-, and triglycerides; animal oils, such as fish, marine, sperm, cod-liver, halver, squillene, squalene, and shark liver oil; oleic oils; and polyoxyethylene castor oil; alky, alkynyl, or aryl halides (these include alkyl or aryl halides having from 1 to about 30 carbons and one or more halogen substituents. Examples include methylene chloride); monoethanolamine; petroleum benzine; trololamine; omega-3 polynsaturated fatty acids (e.g., alpha-linolenic acid, eicosapentaenoic acid, docosapentaenoic acid, or docosahexaenoic acid); polyglycerol ester of 12-hydroxystearyic acid and polyglylycerine glycol (SOLUTOL HS-15, from BASF, Ludwigshafen, Germany); polyoxyethylene glycols; sodium laurate; sodium oleate; and sorbitan monoleate. Other pharmaceutically acceptable solvents for use in the invention are well known to those of ordinary skill in the art. General discussion relating to such solvents may be found in, for example, The Chemistry Source Book (Williams & Wilkins Publishing), The Handbook of Pharmaceutical Excipients, (American Pharmaceutical Association, Washington, D.C., and The Pharmaceutical Society of Great Britain, London, England, 1968), Modern Pharmaceutics 3d ed., (G. Banker et al., eds., Marcel Dekker, Inc., New York, N.Y. (1995)), The Pharmacological Basis of Therapeutics, (Goodman & Gilman, McGraw Hill Publishing), Pharmaceutical Dosage Forms, (H. Lieberman et. al., eds., Marcel Dekker, Inc., New York, N.Y. (1980)), Remington's Pharmaceutical Sciences, 19th ed., (A. Gennaro, ed., Mack Publishing, Easton, Pa., (1995)), The United States Pharmacopeia 24, The National Formulary 19, (National Publishing, Philadelphia, Pa. (2000)); Spiegel, A. J., et al., “Use of Nonaqueous Solvents in Parenteral Products,” J. Pharm. Sciences, Vol. 52, No. 10, pp. 917-927 (1963).

Solvents useful in the invention include, but are not limited to, those known to stabilize the pyrazine compounds or pharmaceutically acceptable salts thereof. These typically include, for example, oils rich in triglycerides, such as safflower oil, soybean oil, and mixtures thereof; and alkyleneoxy-modified fatty acid esters, such as polyoxy 40 hydrogenated castor oil and polyoxyethylene castor oils (e.g., CREMOPHOR EL solution or CREMOPHOR RH 40 solution). Commercially available triglycerides include INTRALIPID emulsified soybean oil (Kabi-Pharmacia Inc., Stockholm, Sweden), NUTRALIPID emulsion (Mccaw, Irvine, Calif.), LIPOSYN II 20% emulsion (a 20% fat emulsion solution containing 100 mg safflower oil, 100 mg soybean oil, 12 mg egg phosphatides, and 25 mg glycerin per ml of solution; Abbott Laboratories, Chicago, Ill.), LIPOSYN III 2% emulsion (a 2% fat emulsion solution containing 100 mg safflower oil, 100 mg soybean oil, 12 mg egg phosphatides, and 25 mg glycerin per ml of solution; Abbott Laboratories, Chicago, Ill.), natural or synthetic glycerol derivatives containing the docosahexaenoyl group at levels of from about 25 to about 100% (by weight based on the total fatty acid content) (DHASCO from Martek Biosciences Corp., Columbia, Md.; DHA MAGURO from Daito Enterprises, Los Angeles, Calif.; SOYACO; and TRAVEMULSION). Ethanol in particular is a useful solvent for dissolving a pyrazine compound or pharmaceutically acceptable salt thereof to form solutions, emulsions, and the like.

Additional components can be included in the compositions of this invention for various purposes generally known in the pharmaceutical industry. These components tend to impart properties that, for example, enhance retention of the pyrazine compound or salt at the site of administration, protect the stability of the composition, control the pH, and facilitate processing of the pyrazine compound or salt into pharmaceutical formulations, and the like. Specific examples of such components include cryoprotective agents; agents for preventing reprecipitation of the pyrazine compound or salt surface; active, wetting, or emulsifying agents (e.g., lecithin, polysorbate-80, TWEEN 80, pluronic 60, and poloxymethylene stearate); preservatives (e.g., ethyl-p-hydroxybenzoate); microbial preservatives (e.g., benzyl alcohol, phenol, m-cresol, chlorobutanol, sorbic acid, thimerosal, and para- benz; agents for adjusting pH or buffering agents (e.g., acids, bases, sodium acetate, sorbitan monolaurate, etc.); agents for adjusting osmolality (e.g., glucose); thickeners (e.g., aluminim monostearate; stearic acid, cetyl alcohol, stearyl alcohol, gua gum, methyl cellulose, hydroxypropylcellulose, tristearin, cetyl wax esters, polyethylene glycol, etc.); colorants; dyes; flow aids; non-volatile silicone (e.g., cyclomethicone); clays (e.g., bentonite); adhesives; bulking agents; flavoring; sweeteners; adsorbents; fillers (e.g., sugars such as lactose, sucrose, mannitol, sorbitol, cellulose, calcium phosphate, etc.); diluents (e.g., water, saline, electrolyte solutions, etc.); binders (e.g., gelatin; gum tragacanth; methyl cellulose; hydroxypropyl methylcellulose; sodium carboxymethyl cellulose; polyvinylpyrrolidone; sugars; polymers; acacia; starches, such as maize starch, wheat starch, rice starch, and potato starch; etc.); disintegrating agents (e.g., starches, such as maize starch, wheat starch, rice starch, potato starch, and carboxymethyl starch; cross-linked polyvinyl pyrrolidone; agar; algic acid or a salt thereof, such as sodium alginate; crosvernorose sodium; crospovidone, etc.); lubricants (e.g., silica; talc); stearic acid and salts thereof, such as magnesium stearate; polyethylene glycol, etc.); coating agents (e.g., concentrated sugar solutions including gum arabic, talc, polyvinyl pyrrolidone, carbopol gel, polyethylene glycol, titanium dioxide, etc.); and antioxidants (e.g., sodium metabisulfite, sodium bisulfite, sodium sulfate, dextrose, phenols, thio phenols, etc.). Techniques and compositions for making parenteral dosage forms are generally known in the art. Formulations for parenteral administration may be prepared from one or more sterile powders and/or granules having a compound or salt of this invention and one or more of the carriers or diluents mentioned for use in the formulations for oral administration. The powder or granule typically is added to an appropriate volume of a solvent (typically while agitation (e.g., stirring the solvent) that is capable of dissolving the powder or granule. Particular solvents useful in the invention include, for example, water, polyethylene glycol, propylene glycol, ethanol, corn oil, cottonseed oil, peanut oil, sesame oil, benzy alcohol, sodium chloride, and/or various buffers. Emulsions for parenteral administration can be prepared by, for example, dissolving a compound or salt of this invention in any pharmaceutically acceptable solvent capable of dissolving the compound to form a solution; and adding an appropriate volume of a carrier to the solution while stirring to form the emulsion. Solutions for parenteral administration can be prepared by, for example, dissolving a compound or salt of this invention in any pharmaceutically acceptable solvent capable of dissolving the compound to form a solution; and adding an appropriate volume of a carrier to the solution while stirring to form the solution. Suppositories for rectal administration can be prepared by, for example, mixing the drug with a suitable nonirritating excipient that is solid at ordinary temperatures, but liquid at the rectal temperature and will therefore melt in the rectum to
release the drug. Suitable excipients include, for example, cocoa butter; synthetic mono-, di-, or triglycerides; fatty acids; and/or polyethylene glycols.

"Topical administration" includes the use of transdermal administration, such as transdermal patches or iontophoresis devices.

If desired, the emulsions or solutions described above for oral or parenteral administration can be packaged in IV bags, vials, or other conventional containers in concentrated form, and then diluted with a pharmaceutically acceptable liquid (e.g., saline) to form an acceptable pyrazine compound concentration before use.

It is understood that this invention is not limited to the particular compounds, methodology, protocols, and reagents described, as these may vary. It is also to be understood that the terminology used herein is for the purpose of describing particular embodiments only, and is not intended to limit the scope of the invention which will be limited only by the appended claims.

Compositions of the invention include formulations and preparations comprising one or more of the present compounds provided in an aqueous solution, such as a pharmaceutically acceptable formulation or preparation. Optionally, compositions of the invention further comprise one or more pharmaceutically acceptable surfactants, buffers, electrolytes, salts, carriers, binders, coatings, preservatives and/or excipients.

Formulations and Use

Compounds and bioconjugates of the present invention may be formulated by known methods for administration to a subject using several routes which include, but are not limited to, parenteral, oral, topical, intradermal, intramuscular, intraperitoneal, intravenous, subcutaneous, intranasal, epidural, and ophthalmic routes. An individual compound/bioconjugate may be administered in combination with one or more additional compounds/bioconjugates of the present invention and/or together with other biologically active or biologically inert agents. Such biologically active or inert agents may be in fluid or mechanical communication with the compound(s)/bioconjugate(s) or attached to the compound(s)/bioconjugate(s) by ionic, covalent, Van der Waals, hydrophobic, hydrophilic or other physical forces. Administration may optionally be localized in a subject. Administration may optionally be systemic.

Compounds and bioconjugates of the present invention may be formulated by any conventional manner using one or more pharmaceutically acceptable carriers. Thus, the compounds/bioconjugates and their pharmaceutically acceptable salts and solvates may be specifically formulated for administration, e.g., by inhalation or insufflation (either through the mouth of the nose) or oral, buccal, parenteral or rectal administration. The compounds/bioconjugates may take the form of charged, neutral and/or other pharmaceutically acceptable salt forms. Examples of pharmaceutically acceptable carriers include, but are not limited to, those described in REMINGTON’S PHARMACEUTICAL SCIENCES (A. R. Gennaro, Ed.), 20th edition, Williams & Wilkins PA, USA (2000).

Compounds and bioconjugates of the present invention may be formulated in the form of solutions, suspensions, emulsions, tablets, pills, capsules, powders, controlled- or sustained-release formulations and the like. Such formulations will contain a therapeutically effective amount of the compound/bioconjugate, preferably in a purified form, together with a suitable amount of carrier so as to provide the form for proper administration to the patient. The formulation should suit the mode of administration.

Parenteral Administration

Compounds and bioconjugates of the present invention may be formulated for parenteral administration by injection (e.g., by bolus injection or continuous infusion). Formulations for injection may be presented in unit dosage form in ampoules or in multi-dose containers with an optional preservative added. The parenteral preparation can be enclosed in ampoules, disposable syringes or multiple dose vials made of glass, plastic or the like. The formulation may take such forms as suspensions, solutions or emulsions in oily or aqueous vehicles, and may contain formulation agents such as suspending, stabilizing and/or dispersing agents.

For example, a parenteral preparation may be a sterile injectable solution or suspension in a non-toxic parenterally acceptable diluent or solvent (e.g., as a solution in 1,3-butanediol). Among the acceptable vehicles and solvents that may be employed are water, dextrose, sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose any bland fixed oil may be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid may be used in the parenteral preparation.

Alternatively, compounds and bioconjugates of the present invention may be formulated in powder form for constitution with a suitable vehicle, such as sterile pyrogen-free water, before use. For example, a compound/bioconjugate suitable for parenteral administration may include a sterile isotonic saline solution containing between 0.1 percent and 90 percent weight per volume of the compound/bioconjugate. By way of example, a solution may contain from about 5 percent to about 20 percent, more preferably from about 5 percent to about 17 percent, more preferably from about 8 to about 14 percent, and still more preferably about 10 percent of the compound/bioconjugate. The solution or powder preparation may also include a solubilizing agent and a local anesthetic such as lignocaine to ease pain at the site of the injection.

Other methods of parenteral delivery of compounds/bioconjugates will be known to the skilled artisan and are within the scope of the invention.

Oral Administration

For oral administration, a compound/bioconjugate of the invention may be formulated to take the form of tablets or capsules prepared by conventional means with one or more pharmaceutically acceptable carriers (e.g., excipients such as binding agents, fillers, lubricants and disintegrants):

A. Binding Agents

Binding agents include, but are not limited to, corn starch, potato starch, or other starches, gelatin, natural and synthetic gums such as acacia, sodium alginate, alginic acid, other alginates, powdered tragacanth, guar gum, cellulose and its derivatives (e.g., ethyl cellulose, cellulose, carboxymethyl cellulose calcium, sodium carboxymethyl cellulose), polyvinyl pyrrolidone, methyl cellulose, pre-gelatinized starch, hydroxypropyl methyl cellulose, (e.g., Nos. 2208, 2906, 2910), microcrystalline cellulose, and mixtures thereof. Suitable forms of microcrystalline cellulose include, for example, the materials sold as AVICEL-PH-101, AVICEL-PH-103 and AVICEL-PH-105 (available from FMC Corporation, American Viscose Division, Avicel Sales, Marcus Hook, Pa., USA). An exemplary suitable binder is a mixture of microcrystalline cellulose and sodium carboxymethyl cellulose sold as AVICEL RC-581 by FMC Corporation.

B. Fillers

Fillers include, but are not limited to, talc, calcium carbonate (e.g., granules or powder), lactose, microcrystalline cel-
lulose, powdered cellulose, dextrates, kaolin, mannitol, silicic acid, sorbitol, starch, pre-gelatinized starch, and mixtures thereof.

C. Lubricants

Lubricants include, but are not limited to, calcium stearate, magnesium stearate, mineral oil, electromagnetic radiation mineral oil, glycerin, sorbitol, mannitol, polyethylene glycol, other glycols, stearic acid, sodium lauryl sulfate, tallow, hydrogenated vegetable oil (e.g., peanut oil, cottonseed oil, sunflower oil, sesame oil, olive oil, corn oil, and soybean oil), zinc stearate, ethyl oleate, ethyl laurate, agar, and mixtures thereof. Additional lubricants include, for example, a synergistic silica gel (AEROSIL 200, manufactured by W.R. Grace Co. of Baltimore, Md., USA), a caugulated aerosol of synthetic silica (marketed by Duvasco of Plano, Tex., USA), CAB-O-SIL (a pyrogenic silicon dioxide product sold by Cabot Co. of Boston, Mass., USA), and mixtures thereof.

D. Disintegrants

Disintegrants include, but are not limited to, agar-agar, alginic acid, calcium carbonate, microcrystalline cellulose, crosslinked sodium, crospovidone, polyvinyl potassium, sodium starch glycolate, potato or tapioca starch, other starches, pre-gelatinized starch, other starches, clays, other alginics, other celluloses, gums, and mixtures thereof.

The tablets or capsules may optionally be coated by methods well known in the art. If binders and/or fillers are used with a compound/bioconjugate of the invention, they are typically formulated as about 50 to about 99 weight percent of the compound/bioconjugate. In one aspect, about 0.5 to about 15 weight percent of disintegrant, and particularly about 1 to about 5 weight percent of disintegrant, may be used in combination with the compound. A lubricant optionally may be added, typically in an amount of less than about 1 weight percent of the compound/bioconjugate. Techniques and pharmaceutically acceptable additives for making solid oral dosage forms are described in Marshall, SOLID ORAL DOSAGE FORMS, Modern Pharmaceutics (Banker and Rhodes, Eds.), 7:359-427 (1979). Other less typical formulations are known in the art.

Liquid preparations for oral administration may take the form of solutions, syrups or suspensions. Alternatively, the liquid preparations may be presented as a dry product for constitution with water or other suitable vehicle before use. Such preparations may be prepared by conventional means with pharmaceutically acceptable additives such as suspending agents (e.g., sorbitol syrup, cellulose derivatives or hydrogenated edible fats); emulsifying agents (e.g., lecithin or acacia); non-aqueous vehicles (e.g., almond oil, oily esters, ethyl alcohol or fractionated vegetable oils); and/or preservatives (e.g., methyl or propyl-p-hydroxybenzoates or sorbic acid). The preparations may also contain buffer salts, flavoring, coloring, perfuming and sweetening agents as appropriate. Preparations for oral administration may also be formulated to achieve controlled release of the compound/bioconjugate. Oral formulations preferably contain 10% to 95% compound/bioconjugate. In addition, a compound/bioconjugate of the present invention may be formulated for buccal administration in the form of tablets or lozenges formulated in a conventional manner. Other methods of oral delivery of compounds/bioconjugates of the invention will be known to the skilled artisan and are within the scope of the invention.

Controlled-Release Administration

Controlled-release (or sustained-release) preparations may be formulated to extend the activity of a compound/bioconjugate and reduce dosage frequency. Controlled-release preparations can also be used to effect the time of onset of action or other characteristics, such as blood levels of the compound/bioconjugate, and consequently affect the occurrence of side effects.

Controlled-release preparations may be designed to initially release an amount of a compound/bioconjugate that produces the desired therapeutic effect, and gradually and continually release other amounts of the compound/bioconjugate to maintain the level of therapeutic effect over an extended period of time. In order to maintain a near-constant level of a compound/bioconjugate in the body, the compound/bioconjugate can be released from the dosage form at a rate that will replace the amount of compound/bioconjugate being metabolized and/or excreted from the body. The controlled-release of a compound/bioconjugate may be stimulated by various inducers, e.g., change in pH, change in temperature, enzymes, water, and/or other physiological conditions or molecules.

Controlled-release systems may include, for example, an infusion pump which may be used to administer the compound/bioconjugate in a manner similar to that used for delivering insulin or chemotherapy to the body generally, or to specific organs or tumors. Typically, using such a system, the compound/bioconjugate is administered in combination with a biodegradable, biocompatible polymeric implant that releases the compound/bioconjugate over a controlled period of time at a selected site. Examples of polymeric materials include polyanhydrides, polylactoesters, polylactides, polylactic acid, polylethylene vinyl acetate, and copolymers and combinations thereof. In addition, a controlled release system can be placed in proximity of a therapeutic target (e.g., organ, tissue, or group of cells), thus requiring only a fraction of a systemic dosage.

Compounds/bioconjugates of the invention may be administered by other controlled-release means or delivery devices that are well known to those of ordinary skill in the art. These include, for example, hydropropylmethyl cellulose, other polymer matrices, gels, permeable membranes, osmotic systems, multilayer coatings, microparticles, liposomes, microspheres, or the like, or a combination of any of the above to provide the desired release profile in varying proportions. Other methods of controlled-release delivery of compounds/bioconjugates will be known to the skilled artisan and are within the scope of the invention.

Inhalation Administration

Compounds/bioconjugates of the invention may be administered directly to the lung of a patient/subject by inhalation. For administration by inhalation, a compound/bioconjugate may be conveniently delivered to the lung by a number of different devices. For example, a Metered Dose Inhaler ("MDI") which utilizes canisters that contain a suitable low boiling point propellant, e.g., dichlorodifluoromethane, dichlorotetrafluoroethane, dichlorotetrafluoroethane, carbon dioxide or other suitable gas may be used to deliver a compound/bioconjugate directly to the lung. MDI devices are available from a number of suppliers such as 3M Corporation, Aventis, Boehringer Ingleheim, Forest Laboratories, Gliaxo-Wellcome, Schering Plough and Vectura.

Alternatively, a Dry Powder Inhaler (DPI) device may be used to administer a compound/bioconjugate to the lung. DPI devices typically use a mechanism such as a burst of gas to create a cloud of dry powder inside a container, which may then be inhaled by the patient. DPI devices are also well known in the art and may be purchased from a number of vendors which include, for example, Fisons, Gliaxo-Wellcome, Inhale Therapeutic Systems, ML Laboratories, Qdose and Vectura. A popular variation is the multiple dose DPI ("MDDPP") system, which allows for the delivery of
more than one therapeutic dose. MDDPI devices are available from companies such as AstraZeneca, GlaxoWellcome, IVAX, Schering Plough, SykePharma and Vectura. For example, capsules and cartridges of gelatin for use in an inhaler or insufflator may be formulated containing a powder mix of the compound/bioconjugate and a suitable powder base such as lactose or starch for these systems.

Another type of device that may be used to deliver a compound/bioconjugate to the lung is a liquid spray device supplied, for example, by Aradigm Corporation. Liquid spray systems use extremely small nozzle holes to aerosolize liquid compound/bioconjugate formulations that may then be directly inhaled into the lung. For example, a nebulizer device may be used to deliver a compound/bioconjugate to the lung. Nebulizers create aerosols from liquid compound/bioconjugate formulations by using, for example, ultrasonic energy to form fine particles that may be readily inhaled. Examples of nebulizer and smoke devices supplied by Sheffield/Systemic Pulmonary Delivery Ltd., Aventis and Batelle Pulmonary Therapeutics.

In another example, an electrohydrodynamic (“EHD”) aerosol device may be used to deliver a compound/bioconjugate to the lung. EHD aerosol devices use electrical energy to aerosolize liquid compound/bioconjugate solutions or suspensions. The electrochemical properties of the compound/bioconjugate formulation are important parameters to optimize when delivering this compound/bioconjugate to the lung with an EHD aerosol device. Such optimization is routinely performed by one of skill in the art. Other methods of intra-pulmonary delivery of compounds/bioconjugates will be known to the skilled artisan and are within the scope of the invention.

Liquid compound/bioconjugate formulations suitable for use with nebulizers and liquid spray devices and EHD aerosol devices will typically include the compound/bioconjugate with a pharmaceutically acceptable carrier. In one exemplary embodiment, the pharmaceutically acceptable carrier is a liquid such as alcohol, water, polyethylene glycol or a perfluorocarbon. Optionally, another material may be added to alter the aerosol properties of the solution or suspension of the compound/bioconjugate. For example, this material may be a liquid such as an alcohol, glycol, polyglycol or a fatty acid. Other methods of formulating liquid compound/bioconjugate solutions or suspensions suitable for use in aerosol devices are known to those of skill in the art.

Depot Administration

A compound/bioconjugate of the invention may be formulated as a depot preparation. Such long-acting formulations may be administered by implantation (e.g., subcutaneously or intramuscularly) or by intramuscular injection. Accordingly, the compound/bioconjugate may be immobilized with suitable polymeric or hydrophobic materials such as an emulsion in an acceptable oil or ion exchange resins, or as sparingly soluble derivatives such as a sparingly soluble salt. Other methods of depot delivery of compounds/bioconjugates will be known to the skilled artisan and are within the scope of the invention.

Topical Administration

For topical application, a compound/bioconjugate may be combined with a pharmaceutically acceptable carrier so that an effective dosage is delivered, based on the desired activity ranging from an effective dosage, for example, of 1.0 μM to 1.0 mM. In one aspect of the invention, a topical formulation of a compound/bioconjugate can be applied to the skin. The pharmaceutically acceptable carrier may be in the form of, for example, and not by way of limitation, an ointment, cream, gel, paste, foam, aerosol, suppository, pad or gelled stick.

A topical formulation may include a therapeutically effective amount of a compound/bioconjugate in an ophthalmologically acceptable excipient such as buffered saline, mineral oil, vegetable oils such as corn or arachis oil, petroleum jelly, Methyl 182, alcohol solutions, or liposomes or liposome-like products. Any of these formulations of such compounds/bioconjugates may include preservatives, antioxidants, antibiotics, immunosuppressants, and other biologically or pharmaceutically effective agents that do not exert a significant detrimental effect on the compound/bioconjugate. Other methods of topical delivery of compounds/bioconjugates will be known to the skilled artisan and are within the scope of the invention.

Rectal Administration

Compounds/bioconjugates of the invention may be formulated in rectal formulations such as suppositories or retention enemas that include conventional suppository bases such as cocoa butter or other glycerides and/or binders and/or carriers such as tragacanth, ethylcellulose, gum tragacanth or gelatin. Rectal formulations can contain a compound/bioconjugate in the range of 0.5% to 10% by weight. Other methods of rectal delivery of compounds/bioconjugates will be known to the skilled artisan and are within the scope of the invention.

Other Systems of Administration

Various other delivery systems are known in the art and can be used to administer the compounds/bioconjugates of the invention. Moreover, these other delivery systems may be combined and/or modified to promote optimization of the administration of compounds/bioconjugates of the present invention. Exemplary formulations that include compounds/bioconjugates of the present invention are described below (the compounds/bioconjugates of the present invention are indicated as the active ingredient, but those of skill in the art will recognize that pro-drugs and compound combinations are also meant to be encompassed by this term):

Kits

Various embodiments of the present invention include kits. Such kits can include a compound/bioconjugate of the present invention, optionally one or more ingredients for preparing a pharmaceutically acceptable formulation of the compound/bioconjugate, and instructions for use (e.g., administration). When supplied as a kit, different components of a compound/bioconjugate formulation can be packaged in separate containers and admixed immediately before use. Such packaging of the components separately can, if desired, be presented in a pack or dispenser device which may contain one or more unit dosage forms containing the compound/bioconjugate. The pack may, for example, comprise metal or plastic foil such as a blister pack. Such packaging of the components separately can also, in certain instances, permit long-term storage without loss of activity of the components. In addition, if more than one route of administration is intended or more than one schedule for administration is intended, the different components can be packaged separately and not mixed prior to use. In various embodiments, the different components can be packaged in one combination for administration together.

Kits may include reagents in separate containers such as, for example, sterile water or saline to be added to a lyophilized active component packaged separately. For example, sealed glass ampoules may contain lyophilized compounds and in a separate ampoule, sterile water, sterile saline or sterile each of which has been packaged under a neutral non-reacting gas, such as nitrogen. Ampoules may consist of any suitable material, such as glass, organic polymers, such as polycarbonate, polystyrene, ceramic, metal or any other material.
typically employed to hold reagents. Other examples of suitable containers include bottles that may be fabricated from similar substances as ampules, and envelopes that may consist of foil-lined interiors, such as aluminum or an alloy. Other containers include test tubes, vials, flasks, bottles, syringes, and the like. Containers may have access port, such as a bottle having a stopper that can be pierced by a hypodermic injection needle. Other containers may have two compartments that are separated by a readily removable membrane that upon removal permits the components to mix. Removable membranes may be glass, plastic, rubber, and the like.

In certain embodiments, kits can be supplied with informational materials. Instructions may be printed on paper or other substrate, and/or may be supplied as an electronic-readable medium, such as a floppy disk, mini-CD-ROM, CD-ROM, DVD-ROM, Zip disk, videotape, audio tape, and the like. Details of the kit may be physically associated with the kit; instead, a user may be directed to an Internet web site specified by the manufacturer or distributor of the kit, or supplied as electronic mail.

REFERENCES

STATEMENTS REGARDING INCORPORATION BY REFERENCE AND VARIATIONS

All references cited throughout this application, for example patent documents including issued or granted patents and/or the inventors' patent applications; and/or patent literature documents or other source material; are hereby incorporated by reference herein in their entirety, as though individually incorporated by reference, to the extent each reference is at least partially not inconsistent with the disclosure in this application (for example, a reference that is partially inconsistent is incorporated by reference except for the partially inconsistent portion of the reference).

The terms and expressions which have been employed herein are used as terms of description and not of limitation, and there is no intention in the use of such terms and expressions of excluding any equivalents of the features shown and described or portions thereof, but it is recognized that various modifications are possible within the scope of the invention claimed. Thus, it should be understood that although the invention has been specifically disclosed by preferred embodiments, exemplary embodiments and optional features, modification and variation of the concepts herein disclosed may be resorted to by those skilled in the art, and that such modifications and variations are considered to be within the scope of this invention as defined by the appended claims.

The specific embodiments provided herein are examples of useful embodiments of the invention and it will be apparent to one skilled in the art that the invention may be carried out using a large number of variations of the devices, device components, methods steps set forth in the present description. As will be obvious to one of skill in the art, the methods and devices useful for the present methods can include a large number of optional composition and processing elements and steps.

When a group of substituents is disclosed herein, it is understood that all individual members of that group and all subgroups, including any isomers, enantiomers, and diastereomers of the group members, are disclosed separately. When a Markush group or other group is used herein, all individual members of the group and all combinations and subcombinations of the group are disclosed individually included in the disclosure. When a compound is described herein such that a particular isomer, enantiomer or diastereomer of the compound is not specified, for example, in a formula or in a chemical name, that description is intended to include each isomer and enantiomer of the compound described individually or in any combination. Additionally, unless otherwise specified, all isotopic variants of the compounds disclosed herein are intended to be encompassed by the disclosure. For example, it will be understood that any one or more hydrogens in a molecule disclosed can be replaced with deuterium or tritium. Isotopic variants of a molecule are generally useful as standards in assays for the molecule and in chemical and biological research related to the molecule or its use. Methods for making such isotopic variants are known in the art. Specific names of compounds are intended to be exemplary, as it is known that one of ordinary skill in the art can name the same compounds differently. It is also understood that there are different ways to chemically depict compounds, for example, grouping certain substituents such as PEG groups.

Many of the molecules disclosed herein contain one or more ionizable groups [groups from which a proton can be removed (e.g., -COOH) or added (e.g., amines) or which can be quaternized (e.g., amines)]. All possible ionic forms of such molecules and salts thereof are intended to be included individually in the disclosure herein. With regard to salts of the compounds herein, one of ordinary skill in the art can select from among a wide variety of available counterions those that are appropriate for preparation of salts of this invention for a given application. In specific applications, the selection of a given anion or cation for preparation of a salt may result in increased or decreased solubility of that salt.

It must be noted that as used herein and in the appended claims, the singular terms “a”, “an”, and “the” include plural reference unless the context clearly dictates otherwise. Thus, for example, reference to “a cell” includes a plurality of such cells and equivalents thereof known to those skilled in the art, and so forth. As well, the terms “a” (or “an”), “one” or more”, and “at least one” can be used interchangeably herein. It is also to be noted that the terms “comprising”, “including”, and “having” can be used interchangeably. The expression “of any of claims XX-YY” (wherein XX and YY refer to claim numbers) is intended to provide a multiple dependent claim in the alternative form, and in some embodiments is interchangeable with the expression “as in any of claims XX-YY.”

Unless defined otherwise, all technical and scientific terms used herein have the same meanings as commonly understood by one of ordinary skill in the art to which this invention belongs. For example, and without limitation, the term “equivalent to those described herein can be used in the practice or testing of the invention, the preferred methods and materials are now described. Nothing herein is to be construed as an admission that the invention is not entitled to antedate such disclosure by virtue of prior invention.

In some embodiments, a liposome or micelle may be utilized for a vehicle for the composition. Every formulation or combination of components described or exemplified herein can be used to practice the invention, unless otherwise stated.

The present compositions, preparations and formulations can be formulated into diagnostic compositions for enteral, parenteral, topical, aerosol, inhalation, or cutaneous administration. Topical or cutaneous delivery of the compositions, preparations and formulations may also include aerosol formulation, creams, gels, solutions, etc. The present compositions, preparations and formulations are administered in doses effective to achieve the desired diagnostic and/or therapeutic effect. Such doses may vary widely depending upon the particular compositions employed in the composition, the organs or tissues to be examined, the equipment employed in the clinical procedure, the efficiency of the component, and the like. These compositions, preparations and formulations contain an effective amount of the composition(s) along with conventional pharmaceutical carriers and excipients appropriate for the type of administration contemplated. These compositions, preparations and formulations may also optionally include stabilizing agents and skin penetration enhancing agents.

Methods of this invention comprise the step of administering an “effective amount” of the present diagnostic compositions, formulations and preparations containing the present compounds, to diagnosis, image, monitor, or evaluate a biological condition and/or disease state in a patient. The term “effective amount,” as used herein, refers to the amount of the diagnostic formulation, that, when administered to the individ-
of such terms and expressions of excluding any equivalents of the features shown and described or portions thereof, but it is recognized that various modifications are possible within the scope of the invention claimed. Thus, it should be understood that although the invention has been specifically disclosed by preferred embodiments and optional features, modification and variation of the concepts herein disclosed may be resorted to by those skilled in the art, and that such modifications and variations are considered to be within the scope of this invention as defined by the appended claims.

What is claimed is:

1. A compound being of the formula (FX1):

(FX1):

wherein:
R₁ and R³ are each independently —(CH₂)ₙ(CH₂CH₂O)ₙR³, —(CH₂CH₂O)ₙR³, or —(CH₂)ₙR³;
Y₁ is independently —OR₂, —(CHOH)ₙR₇, —NR₆R₈, —NHCO(CHOH)ₙR₇ or —NHCO(CH₂)ₙ(CH₂CH₂O)ₙR₆;
each of R₁, R₂, R₃, R₄ and R⁵ are independently —H or C₁₋₃ alkyl;
R₇ and R₈ are independently —H, C₁₋₃ alkyl, —(CH₂)ₙ(CH₂CH₂O)ₙR₈, or —(CH₂)ₙR₈;
each of b and c is independently an integer selected from the range of 0 to 6;
each of p and q is independently an integer selected from the range of 0 to 120;
each of m and n is independently an integer selected from the range of 3 to 6.

2. The compound of claim 1, being of the formula (FX2), (FX3), (FX5), or (FX6):

(FX2)
3. The compound of claim 1, wherein:
each R₅ is independently C₁-C₅ alkyl;
each b is independently an integer from 2 to 50; and
m and n are each independently 3 or 4.
4. The compound of claim 1, wherein the compound is of
the formula (FX7), (FX8), (FX9), (FX10), (FX11), (FX12),
(FX14), (FX15), or (FX16):
wherein d and h are independently integers selected from the range of 1 to 120.

6. The compound of claim 5, wherein each d and h are independently integers selected from the range of 2 to 50, wherein each a is 2, and wherein R⁸ and R⁹ are each \(-\text{CH}_2\text{CH}(_n\text{CHOH})_m\text{R}^\gamma\).

7. The compound of claim 1, being of formula (FX19):

5. The compound of claim 1, being of formula (FX18):

wherein d and h are independently integers selected from the range of 1 to 120.

8. The compound of claim 7, wherein each d and h are independently integers selected from the range of 2 to 50 or the range of 2 to 24.

9. The compound of claim 7, wherein Y¹ is \(-\text{NR}^\gamma\text{R}^\delta\) and wherein R⁸ and R⁹ are each \(-\text{CH}_2\text{CH}(_n\text{CHOH})_m\text{R}^\gamma\) and wherein a is 1 or 2 and c is 2, 3, 4, 5 or 6.

10. The compound of claim 1, being of formula (FX20) or (FX21):
wherein d and h are independently integers selected from the range of 1 to 120.

11. The compound of claim 10, wherein each a is independently 0, 2 or 3, each b is independently 2 to 50, and R7 is C1-C5 alkyl.

12. A method of using a compound of claim 1 in an optical imaging, diagnostic, visualization, monitoring, surgical, biomedical or therapeutic procedure, wherein the procedure comprises:

administering a diagnostically effective amount of the compound to a subject, wherein the compound is differentially separated from a bodily fluid of the subject by an organ, tissue or system in the subject; and

detecting the administered compound.

13. A method of using a compound of claim 1 in an optical imaging, diagnostic, visualization, monitoring, surgical, biomedical or therapeutic procedure, wherein the procedure comprises:

administering an effective amount of a renally excretable compound of claim 1 to a subject;
exposing a tissue of the subject's renal system having the administered compound to electromagnetic radiation, thereby generating emitted electromagnetic radiation from the compound;
detecting the emitted electromagnetic radiation from the compound, thereby visualizing or imaging at least a portion of the renal system of the subject.

14. The method of claim 13, wherein the procedure comprises determining if the administered compound is substantially retained in tissue of the subject’s renal system.

15. The method of claim 12, wherein the compound has plasma binding of less than 10%.

16. The method of claim 13 the biomedical procedure assesses physiological function of an organ, tissue or system.

17. The method of claim 13, wherein the at least a portion of the renal system comprises a ureter, bladder or urethra of the subject.

18. A pharmaceutical composition comprising:
the compound of claim 1; and
a pharmaceutically acceptable excipient.

19. A pharmaceutical composition comprising:
the compound of claim 1; and
one or more additional therapeutic agents or diagnostic agents.

20. The method of claim 13, wherein the compound has plasma binding of less than 10%.
